We examine questions about the nature of emotional reactivity and regulation in old age, its antecedent and correlate conditions, and possible long-term functional implications. We will consider the phenomenon under both controlled conditions in the lab and in-vivo as people go about their daily routines, target both phenomena at experiential and physiological levels, and examine short-term dynamics as well as long-term developments, using participants from the ongoing *Interdisciplinary Longitudinal Study of Adult Development (ILSE)* study who have provided data over the past 20 years and who will be followed over the years to come.

*Sex- and gender-sensitive prevention of cardiovascular and metabolic disease in older adults in Germany (GendAge)*

We make use of comprehensive cardiovascular, metabolic, socioeconomic, and quality of life assessments already available in first wave data from the Berlin Aging Study II to examine sex- and gender-specific disease mechanisms in old age. Ascertainment of second wave data will enable longitudinal analyses to study differences in disease development. We also examine the role of the sociocultural dimension gender for CV risk factors and disease, going well beyond the analysis of biological sex. We will be developing and utilizing a novel measure for gender, one that in particular goes beyond traditional masculinity-femininity stereotypes.

*Aging in Context: Linking Co-Regulation to Variability (CoReAge)*

The proposed Collaborative Research Center/TRansRegio CoReAge builds on the assumption that variability in aging reflects co-regulation processes between individuals and their social contexts. Co-regulation involves the dynamic and mutual interplay between at least two individuals over time or between individuals within social aggregates, including partnerships, the family, neighborhoods, or teams of individuals. Research groups in Erlangen-Nürnberg, Jena, and Berlin will examine research questions revolving around the determinants and processes of interpersonal co-regulation and organizational co-regulation, ranging from post-occupational to caregiving and terminal contexts.

*The importance of neighborhood contexts for affective reactivity and regulation when living with a chronic disease*

Comparing individuals with diabetes and healthy controls, we examine how chronic challenges transcend all aspects of life, including people's affective reactivity and the capability to regulate emotions. Of interest are the co-regulatory contexts in one's proximal social network (e.g., support from close others) and more distal neighborhood (e.g., health services, walkability) that alleviate or exacerbate detrimental outcomes of impaired affective reactivity and regulation. Using a subsample of the Berlin Aging Study-II, we combine ecological validity with experimental rigor by obtaining data with in-vivo ambulatory assessments and under controlled laboratory conditions and collect physiological, performance, self-report, and geo-coded information.
