1 Development of sample sizes

General comment: The sample sizes of the English public use version of the GSOEP and the German DIW version differ by approximately five percent. The exclusion of 5 percent of the original data from the GSOEP was necessary to fulfill the requirements of the German data protection laws. Technically, this was done by dropping randomly 5 percent of the original wave 1 households. All persons and households which stem from these root households are excluded from the English public use version. Hence the difference in sample sizes is not always exactly 5 percent. The sample sizes documented below refer to the original DIW data base.

With respect to the development of sample sizes our focus is on:

- Comparison of the number of successful interviews by cross-section.
- Longitudinal development of panel attrition.
- Entrants by birth or move-ins and their participation behavior.

1.1 Development of the number of successful interviews by cross-section

The following figures display the number of successful interviews considering different aspects:

Figure 1 Comparison for individuals and households (subsamples A and B), waves 1 (1984) to 15 (1998).

Figure 2 Comparison between subsamples A and B on the individual level, waves 1 (1984) to 15 (1998).

Figure 3 Comparison for individuals and households (subsample C), waves 1 to 9.

Figure 4 Comparison between the subsamples A, B and C on the individual level, waves 1 to 9.

Figure 5 Comparison for individuals and households in Subsample D, waves 1 to 4.

Figure 1: Comparison of successful interviews with persons and households (subsample A and B), waves 1 to 15.

Figure 2: Comparison of successful interviews between subsamples A and B (individual level), waves 1 to 15.

Figure 3: Comparison of successful interviews with persons and households (subsample C), waves 1 to 9.

Persons	4,453	4,202	4,092	3,973	3,945	3,892	3,882	3,844	3,730
Households	2,179	2,030	2,020	1,970	1,959	1,938	1,951	1,942	1,886

Figure 4: Comparison of successful interviews between subsamples A and B vs. subsample C (individuals), waves 1 to 9.

Sample A, B	12,245	11,090	10,646	10,516	10,023	9,710	9,519	9,467	9,305
Sample C	4,453	4,202	4,092	3,973	3,945	3,892	3,882	3,844	3,730

Figure 5: Comparison of successful interviews with individuals and households (subsample D), waves 1 to 4.

Persons	1078	1023	972	885
Households	522	498	473	438

Due to the individual regional mobility the power of the initial subsample indicator to predict the actual sampling region vanishes in course of time.

Table 1a displays the actual sampling region of the GSOEP households since 1990 for subsample A, B and C.

Table 1b shows the same information for the immigrant sample since 1995.

Table 1c displays current sample regions for subsample E in 1998.

Table 1a: Development of sample sizes (sample A, B, C) by sampling region and institutional status 1990 to 1998. n = Number of successful interviews, N = Estimated population total in thousands. Population margins for the number of households and individuals living in private households by sampling region are taken from the German microcensus. Because of the different definitorial concepts the figures for the institutional population are not comparable to the microcensus.

	N	13186	20	3036	-
1*: Private households					
2*: Institutionalized population					

Considering the estimated population for sample A and B since 1995 (West) at a household and a personal level, we have to take into account that beginning with wave 12 (1995), the A and B weights are reduced to reflect the fact that immigrants are contained now in sample D (see Rendtel/Pannenberg/Daschke 1997 for details). In addition since 1998 the estimates for samples A, B, C and D are reduced due to the incorporation of the sample E.

1.2 Longitudinal development of losses due to panel attrition

The following figures display the development of the number of losses due to panel attrition considering different aspects:

Figure 6: All first wave persons of subsamples A and B. Whereabout until wave 15.

Figure 7: All first wave persons of subsample A. Whereabout until wave 15.

Figure 8: All first wave persons of subsample B. Whereabout until wave 15.

Figure 9: All first wave persons of subsample C. Whereabout until wave 9.

Figure 10: All first wave persons of subsample D. Whereabout until wave 4.

Figure 11: Comparison of all first wave persons between subsamples A, B and C. Whereabout until wave 9.

Figure 12: Comparison of all first wave persons between subsamples A, B, C and D. Whereabout until wave 4.

The figures in the center display the percentage of records that are without survey related attrition until the corresponding wave. These percentages may be taken as a mark for panel stability.

Figure 6: **All first wave persons (subsample A+B). Development until wave 15.**

Figure 7: All first wave persons (subsample A). Development until wave 15.

Figure 8: All first wave persons (subsample B). Development until wave 15.

Figure 9: All first wave persons of the subsample C. Development until wave 9.

Figure 10: All first wave persons of the subsample D. Development until wave 4.

Figure 11: All first wave persons (A, B, C). Comparison of the development until wave 9.

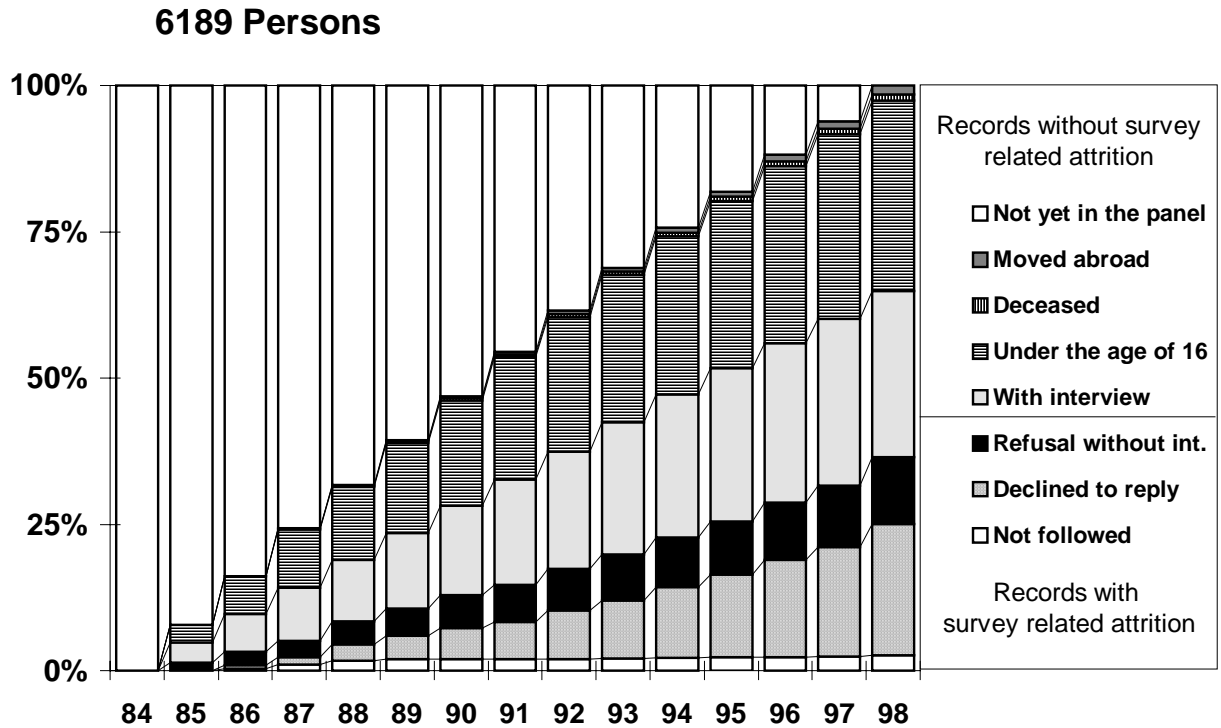

Figure 12: All first wave persons (A, B, C, D). Comparison of the development until wave 4.

1.3 Entrants by birth or move-ins and their participation behavior

Figure 13: Entrants by birth or move-in and their participation behavior (subsamples A, B).

2 Losses due to unsuccessful follow-up

In each panel wave it is necessary to re-contact the households of the proceeding wave. Therefore we have to check whether:

- the household still lives at the old address,
- the entire household has moved,
- all household members deceased,
- all household members left the sampling area,
- all household members returned into an existing panel household.

2.1 Drop-out rates by mobility behavior

Table 2 to 4 display the success of the field work with respect to the recontacting of households for Sample A, B, C and D. The drop-out rates refer to all households of the previous wave that still exist in the sampling area plus split-off households. A contact is regarded to be successfully established if the interviewer recorded an interview or a refusal in the address protocol. Also the detection that the household members returned into an existing panel household is taken as a successful follow-up.

Table 2: **Drop-out rates due to unsuccessful follow-up in the GSOEP subsamples A and B.**

N = Number of households to be recontacted; % = percentage of households without contact.

%	25.6	6.3	13.6	8.6	6.9	5.8	8.4	10.0

Table 4: **Drop-out rates due to unsuccessful follow-up in the GSOEP subsample D.**

N = Number of households to be recontacted;

% = percentage of households without contact.

Characteristic	Wave 2		Wave 3		Wave 4	
	N	%	N	%	N	%
Total	544	0.4	542	0.7	529	0.9
Households without move	431	0.0	424	0.0	409	0.0
Moved multi- person households	74	0.0	65	0.0	65	3.1
Moved single- person households	16	6.3	16	6.3	18	5.6
Split-off households	23	4.4	37	8.1	37	5.4

2.2 Definition of the covariates for a Logit analysis

The estimation of the probability that a household is lost by unsuccessful follow-up is done by using a Logit model with the following characteristics:

Characteristic	Abbreviation	Code	Values
Moved	MOVE	1	household, not moved
		2	Moved multi-person household
		3	Moved single-person household
		4	Split-off household
Large City	LARGE	0	Else
		1	More than 500 thousand inhabitants
Household size	SIZE	1	Single-person household
		2	2 person household
		3	3 person household
		4	4 or more persons household
Single-person household	SINGLE	0	Else
		1	Single-person household
Typ of house	TYP	1	Single house or rural area
		2	Multi storey house
		3	Else
Split-off household	SPLIT	1	Moved multi-person household
		2	Moved single-person household
		3	Split-off household

2.3 Estimated coefficients of the Logit model

The covariates defined in the previous section were employed in a multiple Logit analysis. The model estimates the probability $P_c = (\text{contact} = \text{no})$. For the computation of the GSOEP weighting schemes only model specifications with all covariates being significant were used. The specification

$$\text{is: } \ln \frac{P_{c,i}}{1 - P_{c,i}} = \text{const} + X'_i \beta$$

Thus, positive coefficients indicate an increased drop-out rate compared to the sample average.

Table 5 uses a simple symbolic notation for the models and their estimated coefficients. Here "+" means the addition of a main effect, an "*" indicates an interaction term. Variable 1 (Variable 2 = c) symbolizes a conditional main effect which is linked to cases where variable 2 = c. The estimated coefficients are displayed under the model equation. The notation uses the convention: variable (value 1: coefficient 1/value 2: coefficient 2/...).

The estimated drop out rates due to unsuccessful follow-up may be easily calculated from table 5. For example: In wave 2, subsample A, we find for a multiple-person household, that moved (MOVE=2) from a large city (LARGE=1) the logit value $-2.87+0.24+ 0.11=-2.52$. Thus we have

$$\text{Pr}(\text{contact} = \text{no}) = \frac{e^{-2.52}}{1 + e^{-2.52}} = 0.074.$$

Table 5: **The estimates of a Logit model for the probability of a drop-out due to unsuccessful follow-up in the GSOEP. Representation of coefficients: variable (value 1: coefficient 1/value 2: coefficient 2/...).**

3 Losses due to refusals

3.1 Drop-out rates by different household characteristics

The subsequent tables display the drop-out rates due to refusal by different household characteristics. In general the characteristics refer to their status at the previous interview. However, the survey related characteristics refer to the actual sampling wave.

The person related characteristics refer to the head of the household in the previous wave. However, for split-off households the person related characteristics refer to the person that moved from the panel household (in case of several persons that moved from a panel household: the person first mentioned in the address protocol).

For households which were successfully re-contacted two alternative outcomes were considered:

- an interview is achieved at the household level.
- the household interview was not achieved.

No differences were made between various reasons for the refusal like explicit denial or refusal because of lack of time, bad health conditions, etc..

Table 6: **Participation behavior of re-contacted households by socio demographic characteristics of the head of the household.**

N = Number of eligible households. % = Percentage of households without interview (SOEP Sample A, B).

3.2 Definition of the covariates for a Logit analysis

The characteristics used in the tabulations of the preceding section were employed as covariates in a multiple Logit analysis of the refusal rate. However, we use only model specifications where all included covariates are significantly different from zero. The definition of the covariates is given in the list below:

Characteristic	Abbreviation	Code	Values
Age of the head of household	ALTHV	1	Older than 75 years
		2	65-74 years
		3	55-64 years
		4	35-54 years
		5	25-34 years
		6	Younger than 25 years
Gender of the head	SEX	0	Male
		1	Female
Typ of the household	HTYP	1	Old household without move
		2	Old household moved
		3	Split-off household
Change of interviewer	INTW	0	No change
		1	Change since previous wave
		2	Not regular interviewer number
Number of interviews	BETREUUNG		Number of interviews with the interviewer of the present wave
Starting from the beginning	BEGINN	0	Else
		1	Heads participation since wave 1
Person moving out	AUSZUG	0	Else
		1	A respondent left the household since the previous wave
Separation of a couple	PAAR	0	Else
		1	The head or the spouse (cohabitor) of the previous wave left the household
Interaction of household type and separation of the couple	TYP	0	HTyp = 1,2 and Paar = 1
		1	HTyp = 1 and Paar = 0
		2	HTyp = 2 and Paar = 0
		3	HTyp = 3 and Paar = 0
		4	HTyp = 3 and Paar = 1
East-Berlin	OSTB	0	Else
		1	household is located in East-Berlin

List: continued (1)

Characteristic	Abbreviation	Code	Values
Marital status	FAMSTD	1	Married living together
		2	Married living separately
		3	Single
		4	Divoreed
		5	Widowed
Household income East, quantiles	INCE**	0	No
		1	Yes
Jobless	ALOS	0	Else
		1	Head is jobless
Loss of job (subjective notion)	VERLUST	0	Else
		1	Loss expected or probable
Occupational status of the head	STATUSH	0	Else
		1	High status
Social aid	SOZH	0	Else
		1	Household is recipient of social aid payments
Household income West-Germany	EINKW	1	Income not reported
		2	≤ 2000 DM
		3	2000 - 4000 DM
		4	≥ 4000 DM
Household income (East-Germany)	EINKO	1	Income not reported
		2	≤ 800 DM
		3	800-1200 DM
		4	1200-1800 DM
		5	1800-2500 DM
		6	≥ 2500 DM
Household income not reported	KAEINK	0	Else
		1	Income not reported
Balance of assets not reported	KAVB	0	Else
		1	Balance not reported in wave 5
Number of different kinds of assets in the households	ANZAHL	1	Number = 0
		2	Number = 5 (Maximum)
		3	Else
No assets reported	ANZO	0	Else
		1	Number of reported assets = 0
Firm assets	BETRIEB	0	Else
		1	Household owns firm assets
Savings reported as one kind of assets	SPAR	0	No
		1	Yes
Household migrated from East to West Germany	OSTWEST	0	No
		1	Yes

List: continued (2)

Characteristic	Abbreviation	Code	Values
Member of D-Subsamples	MIGRANT	1	Subsample D1
		2	Subsample D2
Telephone	TELEPHON	0	No
		1	Yes
Subtenant	UNTMETE	0	No
		1	Yes
Apprenticeship	APPRENT	0	No
		1	Yes
Change of interview type	INTWTYPE	0	No
		1	Yes
Satisfaction with life	NSAT	0	No
		1	Yes
Infirmity	INFIRM	0	No
		1	Yes

3.3 Estimated coefficients of the Logit model

The covariates defined above were used in a multiple Logit analysis. The model estimates the probability $P_R = P(\text{Response} = \text{no})$. For the computation of the GSOEP weighting schemes only model specifications with all covariates being significant were used. The specification is:

$$\ln \frac{P_{R,i}}{1 - P_{R,i}} = \text{const} + X'_i \beta$$

Thus, positive coefficients indicate an increased drop-out rate compared to the sample average.

Table 10 uses a simple symbolic notation for models and their coefficients. Here "+" means the addition of a main effect and "*" indicates an interaction term. Variable 1 (Variable 2 = c) symbolizes a conditional main effect which is linked to cases where variable 2 = c. The estimated coefficients are displayed under the model equation. The notation uses the convention: variable (value 1: coefficient 1/value 2: coefficient 2).

The estimated drop-out rates due to refusals may be easily calculated from the coefficients displayed in table 10. For example: In wave 2, subsample A, we find for a household with no change of the interviewer (INTW = 0) and age of the head between 35 and 74 years (ALTHV = 2,3,4) and the reported household income below 2000 DM (EINKW = 2), which did not move (HTYP = 1) the logit value $-1.53 - 0.25 + 0.03 - 0.68 + 0.12 = -2.31$. Thus we have

$$\Pr(\text{Response}=\text{no}) = \frac{e^{-2.31}}{1 + e^{-2.31}} = 0.09.$$

Table 10: **The estimates of a Logit model for the probability of a drop-out due to refusal in the GSOEP. Representation of coefficients: variable (value 1: coefficient 1/value 2: coefficient 2/...).**
