In 1990, during reunification, West German democratic institutions and the existing political party system were expanded to the East German states. Even after 25 years, the people of eastern and western Germany still differ in their political engagement and attitudes.

However, these differences do not apply across the board by any means. A detailed analysis of survey data from the Socio-Economic Panel (SOEP) study shows that differences both in terms of general interest and active participation in politics cannot be identified statistically in many years. By contrast, there are considerable differences between eastern and western Germany in terms of party attachments and actual turnout in national and state elections. The gap in turnout at national elections is not only evident over the years but is also clearly recognizable across all age groups.

There are also still distinct differences in the political party systems of eastern and western Germany. In particular, the Left (Die Linke) plays a major role in eastern Germany but despite some electoral successes in some state parliaments, this party has not been able to establish itself to the same extent in the former West German states. What is more, according to our data, individuals’ attitudes to the welfare state in the two parts of the country, which differed significantly at the beginning of the 1990s, have converged since. Political unification through the accession of the German Democratic Republic to the Federal Republic of Germany 25 years ago on October 3, 1990 created unified government institutions in both parts of the country. The convergence of political attitudes and political participation of citizens in the two parts of the country is, by its nature, a long-term process due to their different past and present experiences and life situations.

The convergence process of life situations is not yet complete in many areas and this is frequently documented in the economy (unemployment, wealth, and productivity), in general attitudes (confidence, self-esteem, and anxiety about the future), and in social aspects (women in work and child daycare).1 While some of the differences are still considerable, in many areas of life a convergence between levels in eastern and western Germany can be observed — albeit in gradual steps. Unemployment in eastern Germany has fallen from its highest levels at the turn of the millennium to 9 percent in 2015 (compared to 5.7 percent in western Germany). Productivity in eastern Germany is increasing slowly (it currently stands at 71 percent of the western German level). Also in terms of women in work and child daycare, the two parts of the country are more closely aligned because western Germany is catching up with eastern Germany. On a positive note, general life satisfaction in the two parts of Germany has continuously converged over the past 25 years.2

---

On the occasion of the 25th anniversary of political uni-
fication, it is of general interest to examine differenc-
es in the political attitudes and political participation of individuals in eastern and western Germany and to
document the development of a unified political culture.3

The country was divided for over 40 years and this has
had a varying impact on the regions, also in terms of
dealing with democracy. While individuals in western
Germany had already had experience of a parliamentary
democracy since 1949, people in eastern Germany were
denied this opportunity up until 1989. Consistent differ-
ces in political participation, electoral behavior, and
attitudes toward government and politics and their own
role in the political system are therefore to be expected
and—as our results show—these are clearly evident.

The following analyses examine the period from
1990 to 2014 and are based on official election data
from the national and state election administrators,
INFRATEST DIMAP, the latest data collected from the
longitudinal Socio-Economic Panel (SOEP)4 study by
DIW Berlin in cooperation with the survey institute
TNS Infratest Sozialforschung and the German General
Social Survey (Die allgemeine Bevölkerungsumfrage der
Sozialwissenschaften, ALLBUS) which is made available
by the Leibniz Institute for the Social Sciences (Leibniz-
Institut für Sozialwissenschaften, GESIS).5 In the follow-
ing trend analysis from 1990, we have distinguished be-
tween adults living in East or West Germany at the time
of the survey or election. It should be noted that official
election data refer to votes by eligible citizens, howev-
er, the survey data comprise all adults living in Ger-
many—including migrants not eligible to vote.6

### Importance of politics and political parties

Active participation in the political process presuppos-
es that citizens consider politics to be relevant to them.
Respondents to the SOEP survey, conducted on an an-
nual basis, indicate how interested they are in politics,7
whether political or social engagement is important
to them personally,8 and whether they feel they have a
long-term attachment to a particular party.9 The repeat-
ed survey, in which more than 25,000 adults currently
participate, was established in 1984 in West Germany
and first conducted in the former GDR in 1990, sever-
al months before political unity.10

The following section examines differences in politi-
ical engagement between citizens in eastern and west-
ern Germany. We have used odds ratios to demonstrate
these differences (see Box). These odds ratios summa-
rize the differences in the shares in a single measure.
An odds ratio value of one means the share of individ-
uals in western Germany who are interested in politics
is equal to the share of individuals in eastern Germany
who are interested in politics. An odds ratio value high-
er than one means that the share of people interested
in politics in western Germany is higher than in east-
ern Germany; a value of less than one means that the
share of those interested in politics is higher in the east.

(ALLBUS) 2014, ZAS240 Datensfile Version 2.0 (Cologne: GESIS Datenarchiv,
2015).

6 The SOEP is able to distinguish between people who lived in West or East
Germany in 1989 (abbreviated to: East and West Germans) as well as between
those who lived in the territory of former West Germany and West Berlin or
in East Germany and East Berlin (abbreviated to: persons in eastern and western
Germany). Both definitions are not identical due to persistent migration between
East and West Germany. Since in the German General Social Survey (ALLBUS)
only the place of residence at the time of the survey is known, we consistently
differentiated between people in eastern and western Germany when analyzing
the survey data. In official election data, the distinction between eastern and
western Germany is only possible up until the national election in 1994 after
which the data only differentiate by state, with West Berlin being designated as
one of the five former West German states (abbreviated to: people from the
former West and former East German states).

7 The question was, “Generally speaking, how interested are you in politics?”
Possible answers were: very interested, moderately interested, not interested,
and disinterested. In our analyses, we only differentiate between interested (very
or moderately interested) and not interested (not interested or disinterested).

8 The question was, “Is social or political engagement important to you
personally?” Possible answers are: very important, important, less important,
and quite unimportant. We also summarized these answers into a binary
indicator from important (less important or quite unimportant) or not
important (very important or important).

9 The question was, “Many people in Germany lean towards one party in
the long term; even if they occasionally vote for another party. Do you lean
towards a particular party?” Possible answers were yes and no.

10 J. Schupp and G. Wagner, “Die DDR-Stichprobe des Sozio-oekonomischen
Panels – Konzept und Durchführung der "Basiserhebung 1990" in der DDR,”
Vierteljahreshefte zur Wirtschaftsforschung; no. 2 (1990): 152-159.
There are no statistically significant differences between east and west in the share of politically interested citizens in most years from 1990 to 2014. While in June 1990 more people were interested in politics in eastern Germany than in western Germany, in some years, such as the national election years of 1998 and 2013, political interest in the west was slightly more pronounced than in the east. In 2013, for example, the share ratio of politically interested individuals to those less interested was around 20 percent higher in the east (an odds ratio value of around 1.21). No clear trend can be observed as far as the question of political interest was concerned.

While differences in the share of politically interested individuals in eastern and western Germany mainly fall within the margins of statistical error and develop unsystematically, the east-west difference on the question of personal importance of political and social commitment is somewhat more pronounced. Then again, it appears that, as expected, during the period of reuni-
Political culture was of greater personal importance to individuals in eastern Germany than those in western Germany. This changed in the ensuing years. Political and social engagement have since been rated personally more important in western than in eastern Germany. Over the entire observation period, statistically significant differences remained largely stable here (see Panel 2, Figure 1). At its peak, in the national election year of 1998, the ratio was 1.55 (in favor of the west).

The most considerable east-west differences were on the question of whether individuals felt a long attachment to a particular political party (see Panel 3, Figure 1). Although East Germans were often familiar with West German parties during the reunification period, as expected, they did not have the same links to these parties as West Germans. In this respect, it is not surprising that the share ratio of individuals with party attachment was higher in the west than in the east in the early 1990s. For example, the odds ratio value in 1992 was around two, which corresponds to 54 percent of long-term party identifiers (compared to 46 percent non-party identifiers) in western Germany and 36 percent party identifiers (compared to 64 percent non-party identifiers) in eastern Germany $((54/46)/(36/64) = 2.09)$. The comparatively high number of east-west differences fell in subsequent years. This convergence is also partly due to a decline in party attachment in western Germany.

---

Currently, the share ratio (odds ratio value) is around 1.5. In 2014, this represented share differences of 50 percent party identifiers in the west and 41 percent in the east.

Overall, the people of eastern and western Germany are very similar in terms of their fundamental interest in politics. Citizens in western Germany, however, consider political and social engagement to be slightly more important. Both findings have remained quite stable over the past 25 years since political unity. There used to be and still are considerable differences with respect to individuals’ identification with political parties, with the shares of long-term party identifiers in both parts of the country slowly converging. This difference is often linked to the volatility of election results: the lower the long-term attachment of individuals to the established parties, the more willing they are to vote for different parties in elections or support new political parties (swing voters).

**Active political participation**

Interest in politics, the perceived importance of political and social engagement, as well as long-term attachment to a party are indeed important factors that favor active participation in the political process but, as expected, these conditions alone are not sufficient. It is therefore important to shed light on the actual political participation of people in eastern and western Germany. To achieve this, the following section considers both participation in elections, the most common form of political participation in Germany, for which official figures are available from national and *Länder* election administrators, and participation in parties, in local politics, and in citizens’ initiatives which we can identify through survey data from the SOEP.\(^{12}\)

For each year, approximately ten percent of all adults stated that they actively participate in political parties, in local politics, and in citizens’ initiatives. The odds ratio value, which expresses the difference in this share between western and eastern Germany, tends to be more than one, thus indicating that the share of politically active people is slightly higher in the west than in the east (see Panel 4, Figure 1). However, this difference fluctuates within the band of statistical uncertainty in most of the years observed. No clear trend is evident in the time series either.

Signs of slight disparities in political participation between the two parts of Germany can be found in the survey data. How do these differences manifest themselves, however, in a measure such as voter turnout which is commonly perceived by citizens as a key instrument for articulating intention in representative democracies?

Figure 2 compares voter turnout in eastern and western Germany at four different election levels (national elections, European elections, state elections and local government elections).\(^{13}\) First, it is clear that voter turnout has decreased over time in both parts of the country across all election levels (in line with trends in many other developed democracies). In national elections, voter turnout was still 82.2 percent in 1998, falling to 71.5 percent in the last election in 2013.

Voter turnout in eastern and western Germany indicates significant differences at almost all election levels. Participation in all national elections in eastern Germany (excluding Berlin) is between three and eight percentage points lower than in the western part of the country. There is also a discrepancy between eastern and western Germany in other elections but the differences are not always so clear. This is only surprising inasmuch as the public perceive national elections as the most important elections in Germany. In the European elections, voter turnout in the east was only lower than that of the west in the 1990s. Since 2004, it has fallen to below 50 percent in both parts of the country. In state elections, the picture in the first four electoral periods after 1990 is mixed: only in recent years has the gap in voter turnout opened considerably (at its height, this gap was 12 percentage points). The historically low participation rates in state elections in Saxony (49.1 percent in 2014), Brandenburg (47.9 percent in 2014), or Saxony-Anhalt (44.4 percent in 2006) give cause for concern.

While the sign of the gap in voter turnout is clear, we identify no clear trend for the differences in voter turnout between eastern and western Germany in the preceding analysis. The discrepancy in the national election remains stable over time. Results are mixed in the European and local government elections and only in the state elections does a trend emerge over time — here, the gap between eastern and western Germany has widened considerably in recent years.

In order to be able to draw a conclusion about the future development of voter turnout, it is worth examining

---

12 In roughly every second year, SOEP participants are asked for detailed information about how they spend their time (question wording: “Please indicate how often you take part in each activity,” to which respondents could answer: daily, at least once a week, at least once a month, seldom or never.” to the activity. “Participation in political parties, municipal politics, and citizens’ initiatives.” We differentiate between those individuals who actively participated daily, weekly, monthly, or seldom and those that never did.

13 In national and European elections, describing voter turnout over time is not a problem since elections in eastern and western Germany took place simultaneously. The timing is not as easy to depict in *Länder* and local government elections as state-specific election periods and election dates make it more complex. We decided to allocate the elections here according to election periods (regardless of the specific election year).
voter turnout across the different age groups (see Figure 3). Here we have used representative electoral statistics from the national election in 2013. Voter turnout across all age cohorts was 67.2 percent in the east and 72.4 percent in the west. The figure clearly shows that the discrepancy in voter turnout is evident across all age cohorts. In fact, the differences are most evident among the oldest (over 70 years) and the youngest (18-21 years) with 7.4 and 6.5 percentage points, respectively. Given this clear picture across all age groups, it is not expected that the gap in turnout in national elections between east and west will close in the foreseeable future.

Democratic forms of direct participation have been introduced in many federal states since around the mid-1990s. In addition to elections, this alternative form of political expression is now available to citizens in all federal states. The number of citizens’ initiatives actually implemented is also suggestive of differences in the culture of political participation. More than 5,000 citizens’ initiatives have been launched all over Germa-
data to draw any conclusions on the extent to which any east-west differences have developed in unconventional forms of participation such as willingness to take part in a political protest.\footnote{17}

"The Left" – Major player in the East but of less importance in the West

The differences in voter turnout are all the more significant, the more political preferences of individuals in eastern and western Germany differ. In particular, the strength of the Left (formerly the Party of Democratic Socialism, PDS) highlights differences in political attitudes.\footnote{18}

Figure 4 shows the results of an opinion poll conducted by infratest dimap, the national election results for all elections since 1990 (5,189 by 2011).\footnote{14} Only 741 directly democratic measures were introduced in eastern Germany (around 4.5 initiatives per 100,000 inhabitants), while 4,448 citizens’ initiatives were launched in the west (6.7 initiatives per 100,000 inhabitants).\footnote{15} These figures also reveal a discrepancy in political participation between eastern and western Germany, bearing in mind that obstacles to implementing\footnote{16} citizens’ initiatives through quorums or similar instruments varied from state to state in the observation period and tended to be greater in eastern than in western Germany.

In summary, there are east-west differences in turnout in national elections and, increasingly, also in state elections as well as in the number of citizens’ initiatives implemented. Alongside these more institutionalized forms of participation, there are considerably fewer east-west differences in locally organized political party engagement, in local government politics, and in citizens’ initiatives. There is a lack of long-term survey

\bibitem{signature} To avoid misuse of initiatives, the law prescribes multiple hurdles for direct democracy such as quorae, signature requirements and negative lists. See Arnold and Freier (2015): Signature requirements and citizen initiatives, Public Choice, Vol. 162(1), 43-56.
\end{thebibliography}
the relevant period, and information on party identification from the SOEP.\(^\text{19}\) All three sources paint a unified picture of the strength of the Left in eastern and western Germany.\(^\text{20}\)

In the opinion poll, support for the Left Party varied in eastern Germany between 14 percent in 2003 and 32 percent in 2005. The collapse around 2002 coincided with the resignation of Gregor Gysi as the Senator for Economics in the Berlin state government. Then, between June 2004 and mid-2005, there was a rapid resurgence in two waves, which was closely linked to the Social Democratic Party (SPD)’s Agenda 2010, the protests of large sections of the labor unions, and the Left Party against these reforms and the political merger of the PDS and the west German Labour and Social Justice – The Electoral Alternative (Wahlalternative Arbeit und sociale Gerechtigkeit, WASG) and with Oskar Lafontaine. Essentially, the time series here hovers around 20 to 25 percent. As a result, the Left can be seen as a major party in eastern Germany.

In western Germany, however, support for the Left Party remained considerably under five percent until mid-2005. When the announcement of a collaboration between the PDS and the WASG was announced in spring 2005, there was a significant rise in the opinion polls. At its height (around the time of the financial crisis in 2008), the figure reached 11 percent. In general, approval in western Germany never exceeds five percent; the Left Party remains on the fringes here.

Figure 5 outlines, by region, differences in election results of the former PDS and later the Left Party in the 16 German federal states. It shows results in the most recent elections for each state and a comparison with previous elections in parentheses. The figure clearly shows that the Left reported strong results across the board at all election levels. The variation here is minimal (with a few exceptions in state and local government elections). The success of the Left in the eastern federal states is also reflected in the number of representatives they have in government. Bodo Ramelow was the first member of the Left Party to be elected Minister-President of Thuringia, a position he has held since 2014.

As indicated above, the Left Party has much less support in western Germany. In addition, there are considerable regional disparities. The Left Party’s strongest sup-

\(^{19}\) In the SOEP, the question is divided into two parts. The first part asks whether respondents are generally inclined toward a particular party in Germany (see Figure 1). The second part asks respondents which party they feel affiliated to. We calculate the share of those with a party preference for the Left Party to respondents who generally indicated a long-term party attachment.

Convergence in attitudes toward the welfare state

The successes of the Left in eastern Germany are often attributed to the perception of the party as the representative of eastern German regional interests, and to the greater political orientation of the people of eastern Germany to the left. In fact, a number of previous studies show that issues of equality and redistribution of incomes are more pronounced in eastern Germany than in western Germany.\(^\text{21}\)

As part of the German General Social Survey (ALLBUS), respondents have been asked the following four questions repeatedly since 1991:

- “On the whole, do you consider the social differences in our country just.”
- “On the whole, are economic gains in Germany distributed justly today?”
- “Do you think the state must ensure that people receive a decent income even in illness, hardship, unemployment and old age?”
- “Should social benefits be cut in the future, should things stay as they are, or should social benefits be extended”

Approximately 66 percent of respondents consider social differences to be unjust on the whole (completely agree/tend to agree/tend to disagree/completely disagree), 79 percent think the distribution of economic gains is unjust (completely agree/tend to agree/tend to disagree/completely disagree), 88 percent believe the state has a responsibility in cases of illness, hardship, unemployment, and old age (completely agree/tend to agree/tend to disagree/completely disagree), and, finally, 32 percent are in favor of extending social benefits (compared to reducing them or maintaining the status quo).

Panel 1 shows that in the first ten years after reunification the odds ratio value remained relatively stable at a very low 0.2. This corresponds to approximately 85 percent of respondents from eastern Germany who perceive injustices compared to around 55 percent in western Germany \([55/45]/[85/15] = 0.22\). After 2000, however, there was a slow convergence of the views of people in eastern Germany, indicating a growing similarity in attitudes towards the welfare state between the two regions.

Figure 6 outlines the differences in attitudes to the welfare state between western and eastern Germany based on odds ratio values. The share of respondents from eastern Germany who believe there are injustices and are in favor of a strong welfare state was higher than in western Germany. (The odds ratio values are consistently lower than one.) Significant differences in vote shares throughout all levels of elections.

and western Germany on the issue of justice and social differences resulting in the odds ratio value rising to approximately 0.45 in 2014. A similar picture emerges with regard to the question of whether economic gains are unjustly distributed (see Figure 6, Panel 2). Despite the slow increase, the difference is still clear and statistically significantly different from one. This shows that 25 years after unification, people in eastern and western Germany still have different perceptions of what is fair.

Panel 3 indicates that the odds ratio values on the question whether the government should provide for individuals in cases of illness, hardship, unemployment, and old age are initially much less than one. However, the differences between eastern and western Germany have reduced considerably over time. The odds ratio value at the beginning of the 2000s was 0.5. In 2014, the ratio is no longer significantly different from one (i.e., parity). This implies that preferences are now largely aligned and both western and eastern Germans have similar views on the tasks of government. It should be noted that there was a broad consensus throughout the observation period that it was the government’s responsibility to help in cases of illness, hardship, unemployment, and old age: in 1991, almost 99 percent of eastern Germans thought it was one of the tasks of government, compared to 91 percent of western Germans. In 2014, the corresponding figures were 91 percent in the east and 88 percent in the west. Eventually, the shares of those in favor of expanding social services also converged, although the share in eastern Germany is still higher than in western Germany.

In contrast to political engagement and voter turnout in elections—the most profound differences overall between eastern and western Germany were found in attitudes to the welfare state; however, in these attitudes we also found the strongest alignment in political culture.
Conclusion

Although German Chancellor Angela Merkel and Federal President Joachim Gauck are both from East Germany and hold the top political offices in Germany, political unity has not occurred in the attitudes of citizens toward politics and participation in the political process.

In terms of general interest in politics and active participation in local politics (working for political parties, in local government politics, and citizens’ initiatives), the differences are often slight and statistically insignificant. Individuals from eastern and western Germany are politically engaged to a very similar degree.

There are, however, disparities in party attachment and voter turnout. Although the population in eastern Germany was quite familiar with the political system of the West at the time of reunification, attachment to specific parties is still considerably less pronounced in eastern Germany. There is, however, a slow convergence between people of eastern and western Germany. Today, there are virtually no differences in willingness to have a long-term attachment to a political party among the generation of citizens who were children and adolescents during the period of reunification.²² There is, however, an alarming discrepancy in voter turnout, especially in national elections, which has remained constant for many years and across all age groups. Even more dramatic is the trend in participation in state elections, where the 50 percent threshold in voter turnout was often missed in recent years.

Clear differences can be identified between eastern and western Germany in terms of political preferences (in addition to people in eastern Germany supporting the Left Party) and attitudes to the welfare state: individuals in eastern Germany would like a stronger welfare state to provide support in social emergencies and would like to expand social benefits accordingly. In addition, social inequality and the distribution of economic gains are perceived as far more unjust than in western Germany. However, it is worth noting that after 2002 attitudes toward the welfare state—despite continuing differences—slowly began to converge between east and west.

²² As part of the analyses conducted for the present article, all east-west differences were also calculated for those born after 1975, i.e., who were children or adolescents during the period of reunification. The pattern of east-west differences for this generation who grew up in a unified Germany mostly coincides with those of the entire population. One exception is the difference between east and west in long-term attachment to political parties. See also M. Kroh and H. Schoen, “Politisches Engagement,” in Leben in Ost und Westdeutschland: Eine sozialwissenschaftliche Bilanz der deutschen Einheit 1990–2010, eds. P. Krause and I. Ostner (Campus, 2010).
