

# Income, social support networks, life satisfaction: lesbians, gays, and bisexuals in Germany

By Martin Kroh, Simon Kühne, Christian Kipp and David Richter

Towards the very end of this legislative period, a cross-caucus parliamentary majority gave same-sex marriage the green light – progress for the legal equality of homosexuals in Germany. This report focuses on the life situations of homosexual and bisexual people in Germany. The careers they pursue, for example, differ from those of heterosexuals. Hourly wages are an area of significant disparity: homosexual and bisexual men earn less per hour than heterosexual men with the same qualifications in comparable professions. While differences in personality structure are virtually nonexistent, homosexuals and bisexuals describe themselves as less satisfied with their lives and under more psychological stress. An analysis based on the data from the Socio-Economic Panel (SOEP) at the German Institute for Economic Research yielded these and other results. The SOEP is one of the few representative population surveys in Germany that collects information on the sexual orientation of participants. Expanding the scope of regular social reporting to include data on sexual orientation would make it possible to better document differences in life situations and to more effectively identify where action is needed – such as in fighting discrimination.

Equal rights for homosexuals have been a hot topic of debate in Germany for some time now, but representative population survey data on lesbians, gays, and bisexuals (abbreviated as “LGBs,” see Box 1) are relatively rare. This is surprising because the European Union’s Charter of Fundamental Rights prohibits discrimination based on sexual orientation,<sup>1</sup> and EU institutions have repeatedly advised member states to monitor the equality of LGBs in various areas of life.<sup>2</sup>

## Box 1

### Collecting LGB statistics

In the present report, we call people who self-identify as sexually attracted to members of their own sex “LGB” (lesbian, gay, and bisexual). The SOEP report was based on the responses of 459 homosexuals and bisexuals and 39,100 heterosexual respondents (unweighted number of cases). Due to the comparatively low number of LGB cases, we did not systematically differentiate among lesbians, gays, and bisexuals within the LGB group. We concentrated primarily on comparing LGB respondents on the one hand with heterosexual respondents on the other.

Further consideration of gender identity would permit a more detailed differentiation into LGBTIQ: lesbian, gay, bisexual, trans, intersex, and queer. However, even with the overall number of cases in the SOEP, statistically robust statements that can be made involving sexual orientation and gender identity are limited.

<sup>1</sup> Charter of Fundamental Rights of the European Union (2000). (Available online, accessed August 8, 2017; the same also applies for all other online sources mentioned in this report unless stated otherwise).

<sup>2</sup> See for example European Parliament, “Resolution of 4 February 2014 on the EU roadmap against homophobia and discrimination on grounds of sexual orientation and gender identity,” (available online).

## Box 2

**On surveying sexual orientation in the SOEP**

The sexual orientation of respondents to the Socio-Economic Panel (SOEP), a recurring annual representative survey of private households in Germany,<sup>1</sup> is measured based on two strategies.

Since the first survey in 1984, the SOEP has included information on the composition of participating households (Household Questionnaire) and the individual information of the respondents (Individual Questionnaire), both of which are updated annually. More specifically, it includes the relational structure of all persons living in the household. In this way, it is possible to identify kinship (e.g., mother/child) and partnerships (e.g., wife/husband) among the members of a household. Information on the respondent's sex and that of their partner in the household allows for distinguishing between different- and same-sex couples. We considered the SOEP survey period from 2010 to 2016 for our analyses. People who had a partner of the same sex in one of the years in this period were assigned to the LGB group. People who lived with a partner of a different sex for at least two years and had never had a partner of the same sex were assigned to the heterosexual group.<sup>2</sup>

**1** Gert G. Wagner et al., "Das Sozio-oekonomische Panel (SOEP): Multi-disziplinäres Haushaltspanel und Kohortenstudie für Deutschland – Eine Einführung (für neue Datennutzer) mit einem Ausblick (für erfahrene Anwender)", *AStA Wirtschafts- und Sozialstatistisches Archiv* no. 2.4 (2008): 301–328.

**2** People who indicated for one year only that they had had a partner of a different sex could be either hetero or bisexual. For this reason, we determined that two years of information on heterosexual partnerships would be an adequate filter for reducing the number of bisexual respondents that were incorrectly grouped with heterosexuals. Nor is it sufficient to use information on partners of different sexes for the same person as a criterion for distinguishing between bisexual respondents and homosexual

The approach described above does not allow for statements about people who are not in a relationship or couples who "live apart together." And bisexual respondents in stable partnerships with a person of the opposite sex are incorrectly grouped with heterosexuals. These are the main reasons why a direct question about sexual orientation was integrated into the SOEP core sample questionnaire in the 2016 survey. Participants were asked whether they consider themselves heterosexual, homosexual (lesbian or gay), bisexual, or none of the above.<sup>3</sup>

Yet the direct question about sexual orientation is not without possible sources of error. In 2016, almost 13 percent of respondents refused to answer the question, either by refusing to answer outright or by selecting the answer "None of the above." Because we can assume that LGB respondents in particular decided not to answer the question due to their fear of rejection by the interviewer or in order to criticize the question itself,<sup>4</sup> we applied a correction factor when calculating the proportion of LGBs in the adult population. It gives a higher weighting to respondents who possess the typical characteristics of those who refused to answer. For example, this applies to older people, to

respondents, since both bisexuals and homosexuals could have a stable relationship with a partner of the same sex.

**3** The exact wording of the question is: "In the context of relationships, the question of sexual orientation arises. Would you describe yourself as ...?" The available answers were "Heterosexual or straight (that is, attracted to the opposite sex)", "Homosexual (gay or lesbian, that is, attracted to the same sex)", "Bisexual (attracted to both sexes)", "Other" and "No answer/Prefer not to say".

**4** On possible problems involved in sensitive survey subjects, see: Roger Tourangeau and Ting Yan, "Sensitive Questions in Surveys," *Psychological Bulletin*, 133(5) (2007): 859–883.

However, even seemingly trivial facts, such as the total number of LGBs living in Germany, are based on rough estimates at best (see Box 2). And based on the 2016 microcensus, the German Federal Statistical Office (*Statistisches Bundesamt*) reported that 0.46 percent of cohabiting couples in Germany are of the same sex<sup>3</sup>, but little is known about how many persons living without

a partner—around one-third of the adult population<sup>4</sup>—are hetero-, bi-, or homosexual.

The Socio-Economic Panel (SOEP) at the German Institute for Economic Research (DIW Berlin) is attempting to close this research gap by not only collecting data on the sex of two partners in a surveyed household but also requesting voluntary information on respondents' sexual orientation. The SOEP encompasses a wide range of subjects, including everything from employment, social

**3** The German Federal Statistical Office reported 95,000 cohabitating same-sex couples and 20,612,000 cohabitating couples in Germany in total. See Destatis (2017): Gleichgeschlechtliche Lebensgemeinschaften. (accessible online, last access August 24th, 2017); and Destatis (2017): Paare nach Lebensform (accessible online, last access August 24th, 2017);

**4** Elle Krack-Roberg et al., "Familie, Lebensformen und Kinder," *Datenreport 2016: Sozialbericht für Deutschland*, (PDF, German Federal Statistical Office (Destatis), Wiesbaden, 2016) (available online).

people with a partner in the household, and to specific survey modes.<sup>5</sup>

Another possible source of error is incorrect information provided intentionally to meet presumed societal expectations. This is why the analyses and estimates presented in this report refer solely to LGBs who live openly as such.

In all likelihood, the extent of incorrect information and the resulting underestimation of the proportion of LGB respondents vary across age groups (see Table). Not unexpectedly, at 25 percent, the proportion of 17- to 29-year-olds among LGBs in the SOEP sample is twice as high as the proportion of this age group among heterosexual respondents. The reverse holds true among respondents age 60 and over: 15 percent of the LGBs and 34 percent of the heterosexuals in the sample are in that age group. The average LGB age is 42, which is significantly lower than that of heterosexuals at 52.<sup>6</sup>

Differences in the life situations of hetero and LGB respondents could simply be due to the measured differences in age. In order to enable comparisons between LGBs and heterosexuals despite that fact, we used the "Propensity Score Weighting" method

**5** Initial analyses indicate that in a face-to-face survey situation, respondents refuse to provide information on their sexual orientation less often than respondents who complete the interview on their own. However, in face-to-face interviews, the frequency of LGB identification decreases. A similar pattern is evident when a third person is present during the interview.

**6** Although a biological mechanism of sexual orientation should be independent of age, the age-dependent differences indicate that a social process is involved in the reported identification with a sexual orientation.

by age group. We weighted the subsample of heterosexual respondents to make their age distribution correspond to that of the relevant distribution of the LGB subsample. Weighted in this way, the data allow for comparison between LGBs and heterosexuals of the same age. For informational purposes, the tables also contain the values for heterosexual respondents without adjustment for age.

To classify the SOEP study participants as hetero, bi-, or homosexual, we used both self-reported information on sexual orientation as well as information on the sex of current and former partners.

Table

Example: 17- to 29-year-olds make up 13 percent of the heterosexual adult population and 25 percent of the homosexual and bisexual adult population.

networks, health, and wellbeing to personality structures. This allows for an overview of differences and similarities in heterosexual and LGB respondents in various areas of life.

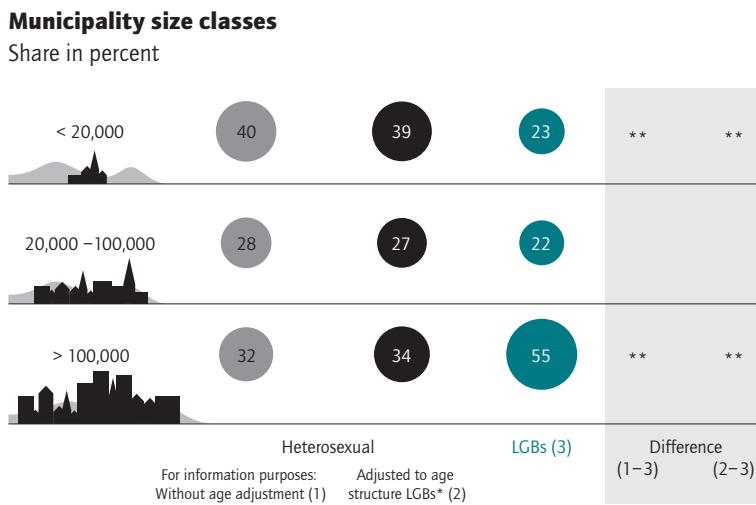

**More lesbians, gays, and bisexuals live in Germany than recorded in official statistics**

Based on the 2016 microcensus, the German Federal Statistical Office has released its most up-to-date figure: 95,000 same-sex couples living together in one household—an increase of 53 percent in ten years. However, related to all cohabiting couples in Germany in 2016, same-sex couples only represent a proportion of 0.46 percent. In other Western countries that publish comparable

data, the proportion is in some cases two times higher. For example, the United States Census Bureau reported a proportion of one percent same-sex couples; Statistics Canada reported 0.9 percent, and the value for France is 0.6 percent.<sup>5</sup>

**5** For an overview, see Andrea Lengerer, "Quality of Official Data on Cohabiting Same-Sex Couples in Germany," presentation at 7th Conference of the European Survey Research Association (ESRA), 2017. For information on the US, see: Daphne Lofquist et al., "Households and Families: 2010," *2010 Census Briefs*, (PDF, United States Census Bureau, Washington, D.C., 2013). © DIW Berlin 2017

LGBs live in small municipalities less often than heterosexuals.

In the 2016 SOEP survey, the estimated number of same-sex couples in private households was 0.9 percent. Due to sampling error, which leads to uncertainty in the estimates, the value lies between 0.7 percent (lower estimate) and 1.1 percent (upper estimate) of all cohabiting couples in Germany. When respondents' partnership information from earlier SOEP surveys is added, the proportion rises above 1 percent.

With this method, LGBs who do not currently have a partner or do not cohabit with their partner are not recorded. Survey-based studies must rely solely on the voluntary self-disclosure of sexual orientation (see Box 2). On the basis of this information, we estimated that approximately 1.9 percent of adults in Germany self-identify as homo- or bisexual (lower estimate 1.6 percent; upper estimate 2.2 percent). At just below three percent, the proportion of LGBs who live alone is significantly higher than that of LGBs cohabiting with a partner (1.3 percent). And at 2.8 percent, people under 45 self-identify as LGB more frequently than people over 60 (just below one percent).

In the UK and Australia, where self-reported information on sexual orientation is collected in large household

*Opinion Quarterly* 77 (2013): 145-158. For information on Canada, see Heather Lathe et al., "Same-sex couples in Canada in 2016," (PDF, Census in Brief Statistics Canada, Ontario, 2017). (available online; accessed July 22, 2017). For information on France, see Clara Cortina and Patrick Festy, "Same-sex couples in the census," (News article, Institut National D'Études Démographiques, Paris, 2017). (available online; accessed July 22, 2017)

surveys similar to the SOEP, the estimated proportion of LGBs in the population is somewhat higher than in Germany. In the UK, LGBs make up an estimated 2.3 percent of the population, based on data from 2012 and the UK Household Longitudinal Study (UKHLS). In Australia, based on data from the Household, Income and Labour Dynamics in Australia (HILDA) survey, LGBs make up an estimated 2.6 percent of the population.<sup>6</sup>

It is important to remember that these are estimates of the number of people who are in openly homosexual living situations or who identified as such in an interview situation, not those with homosexual tendencies in the general population. The latter figure is probably considerably higher, but there are virtually no studies to date that could provide a reliable estimate.<sup>7</sup>

**Most registered civil partnerships in Germany are in Berlin**

More than half of lesbians, gays, and bisexuals in Germany live in major cities with over 100,000 residents, compared to only around one-third of heterosexuals (Figure 1). The sample size of the microcensus conducted by the German Federal Statistical Office is not large enough to deliver a reliable estimate of the proportion of same-sex couples in Germany's large cities. However, registry office data on registered civil partnerships (*Lebenspartnerschaften*) and marriages of same-sex couples show that in 2015, the most same-sex unions by far were in Berlin (834), followed by Cologne (291) and Hamburg (251) (Figure 2). Of all civil partnerships and marriages registered in Berlin, 5.7 percent were of same-sex couples. This puts Germany's capital city at the top of the five largest German cities when it comes to the proportion of registered civil partnerships, followed by Cologne and Frankfurt/Main with five percent each. Schleswig-Holstein and Saarland are the federal states with the highest proportion of new registered civil partnerships (both over two percent).<sup>8</sup>

**6** For the calculation, the unweighted numbers of LGBs were considered in relation to the sum of respondents who identify themselves as either LGB or hetero. See Mark Wooden, *The Measurement of Sexual Identity in Wave 12 of the HILDA Survey - and Associations with Mental Health and Earnings*, (Melbourne, University of Melbourne, 2014). For an overview, also see Gary J. Gates, "How Many People are Lesbian, Gay, Bisexual and Transgender?" (PDF, The Williams Institute/University of California, Los Angeles, 2011). (available online; accessed July 22, 2017)

**7** Based on a widely cited Internet survey, Dalia Research estimates the proportion of LGBT (lesbian, gay, bisexual, and transsexual) people in Germany at 7.4 percent—far more than all other estimates. We do not have any information on the survey's sampling and measurement errors. See Dalia Research, "Counting the LGBT Population," (Website, Dalia Research, Berlin, 2017). (available online; accessed July 22, 2017)

**8** At 1.8 percent of all same-sex marriages or registered civil partnerships in 2015, the proportion of newly established same-sex partnerships throughout Germany is four times higher than the proportion of same-sex couples among

## LGBs are less likely to be in a relationship and more likely to have support networks outside the family

According to the SOEP data, lesbians, gays, and bisexuals are less likely to be in a relationship than heterosexuals (Figure 3). Both the proportion of singles and the proportion of individuals “living apart together” are higher in the LGB community. While around 70 percent of all respondents in same-sex relationships reported living with their partner in the same household, the proportion among heterosexual couples of the same age is over 10 percent higher.

Ten percent of homosexual and bisexual respondents indicated that they live in a household with a child under 14. Among heterosexuals in the same age range, the proportion was 27 percent.<sup>9</sup> This does not necessarily presume a parent/child relationship.

While 28 percent of cohabiting heterosexuals live in single-income households, the proportion is significantly lower among homosexual couples at 18 percent. The proportion of dual-income households is accordingly higher among same-sex couples.

### Social support networks

At regular intervals, SOEP respondents report on their social support networks: the “persons with whom they share their thoughts and feelings or talk about things they would not tell just anyone,” or “who they would ask for help in the hypothetical case of requiring long-term care after a serious accident, for example.”

There is no statistically significant difference between LGBs and heterosexuals when it comes to the existence of a support network (see Table 1). Only around six percent of LGB respondents and approximately four percent of heterosexuals reported that they do not have a confidant with whom they share their personal thoughts and feelings. Nine and five percent, respectively, indicated that they would have no one to turn to for help if they needed long-term care. And regardless of their sexual orientation, most respondents viewed their partner as an important source of support. Around 90 percent

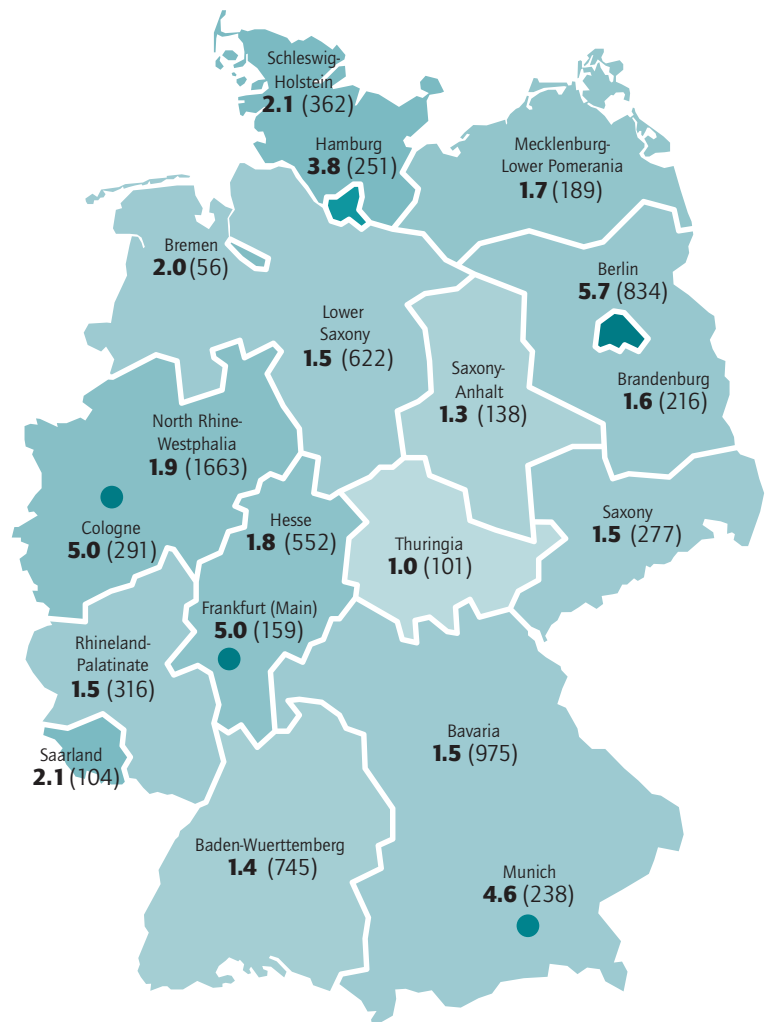

all couples in the 2016 microcensus (0.46 percent). This discrepancy can be due to many reasons, for example, differences in age. However, it could also be due to the underrepresentation of same-sex couples in surveys.

<sup>9</sup> Based on the 2012 microcensus on cohabiting same-sex and different-sex couples, this difference is higher (authors' calculations based on the Scientific Use File), in particular because the proportion of heterosexual couples that live with children in one household is higher. This tendency is also apparent when heterosexual SOEP respondents are limited to the group of persons living in partnerships.

Figure 2

Dual-earner households are more prevalent among LGBs than heterosexual couples.

other relatives) were their confidants (61 percent) or persons who they would turn to if they needed long-term care (56 percent) was around ten percentage points lower in each case than it was for heterosexual respondents of the same age (72 percent and 67 percent respectively). At the same time, the proportion of persons who counted friends and acquaintances among their support network was ten percent higher for LGBs than for heterosexuals (59 percent vs. 46 percent said friends and acquaintances were their confidants and 36 percent vs. 28 percent would turn to friends if they needed long-term care).<sup>10</sup>

<sup>10</sup> Karsten Hank and Veronika Salzburger, "Gay and Lesbian Adults' Relationship With Parents in Germany," *Journal of Marriage and Family* 77 (2015) found that based on data from pairfam - The German Family Panel, there is no difference in the ties between hetero- and homosexual children and their parents in the long term. However, other studies suggest that when homosexuals

**LGBs pursue different careers and earn less**

**Education, gainful employment, and occupational status**

On average, SOEP respondents who identified themselves as lesbian, gay, or bisexual had somewhat higher educational levels than heterosexual respondents: more LGB respondents had university entrance qualifications as opposed to intermediate secondary or lower secondary school diplomas (Table 2). Forty-seven percent of LGBs reported having university entrance qualifications,

or bisexuals come out, this often has an adverse effect on relationships within the family.

compared to 36 percent of heterosexuals. These differences have a certain level of statistical uncertainty but appear to be reliable, as our analyses of the 2012 micro-census showed a similar pattern. It is striking that such a low percentage of LGBs completed vocational training after graduating with an intermediate or lower secondary diploma.

In contrast to heterosexuals, homosexual and bisexual workers are less often employed as blue-collar workers (11 vs. 23 percent) and more often as white-collar workers (78 percent vs. 61 percent for heterosexuals). And at two percent, the proportion of civil servants in the LGB community is particularly low (for heterosexuals, six percent). Looking at the results by sector, comparatively few LGBs indicated that they were employed in

manufacturing or in the transportation, logistics, security and safety sector.<sup>11</sup>

**"Sexuality pay gap" among men**

We also compared homosexuals and bisexuals to heterosexuals with regard to their gross hourly wages (measured by actual hours worked<sup>12</sup>) (Figure 4). Heterosexual

<sup>11</sup> The sampling error is quite high due to the low number of cases, but in our own analyses of the 2012 Microcensus Scientific Use File, we find similar differences by sector.

<sup>12</sup> Even if contractual instead of actual working hours are used to calculate hourly wages in the SOEP, homosexual and bisexual men still have lower hourly wages, but the difference from those of heterosexual men is not as large. The extent to which average hours worked exceed contractual working hours is significantly higher among homosexual and bisexual men than among heterosexual men.

Figure 4

**Sexuality pay gap in gross hourly wages**

© DIW Berlin 2017

**Gay and bisexual men earn less than heterosexual men.**

men earn considerably higher hourly wages (average hourly wage of 18.14 euros) than heterosexual women (14.40 euros), bi-/homosexual women (16.44 euros) and bi-/homosexual men (16.00 euros). These differences persisted even when we statistically controlled for differences in qualifications, occupational status, professional experience, working time models, and sectors. The difference between men rose to 2.64 euros when we controlled for the higher education levels of homosexual and bisexual respondents. The hourly wages of bi-/homosexual women did not differ from those of bi-/homosexual men or heterosexual women with any statistical significance.

Alongside the well-documented gender pay gap<sup>13</sup> (women earning lower wages), the data indicate a sexuality pay

<sup>13</sup> See the definition of the gender pay gap in the DIW glossary (in German only, available online). For studies, see Anne Busch and Elke Holst, "Verdienstunterschiede zwischen Frauen und Männern nur teilweise durch Strukturmerkmale zu erklären." *DIW Wochenbericht* no. 15 (2008): 184-190; Claudia Gather

gap that affects homosexual and bisexual men to a significant extent. The observed sexuality pay gap in Germany is similar to that in other Western countries.<sup>14</sup>

Because there are more dual-income households in the LGB community and the households are smaller than those of heterosexuals on average, the wage difference does not pose a disadvantage with regard to disposable household income.

**LGBs are less satisfied with their lives and more likely to suffer from depression**

Previous research has found that LGBs have a lower sense of wellbeing and higher risk of psychological problems.<sup>15</sup> It is argued that due to their sexual orientation, LGBs are stigmatized and discriminated against, triggering a condition of chronic stress. However, there is a positive relationship between social and self-image based on the extent of one's "outness"—that is, the degree to which a person's actual homosexual self-image matches the image that he/she presents to society.<sup>16</sup>

As a measure of psychological health, the SOEP provides a value that is a weighted combination of the answers to five individual questions, for example: "In the past four weeks, how often have you felt down and gloomy?" or "[...] how often have you felt that you achieved less than you wanted to at work or in everyday activities due to mental health or emotional problems?" The scale of answers is standardized to yield a mean of 50 points and around 68 percent of respondents had a value in the 40- to 60-point range.<sup>17</sup> Every two years, SOEP respondents are also asked whether they were ever diagnosed with a depressive disorder.

In the SOEP, the value for general life satisfaction is based on the question, "How satisfied are you with your life, all things considered?" The answers are ratings on a scale of zero (completely dissatisfied) to ten (completely satisfied).

fied). Based on the same scale, respondents also give their answers on life satisfaction in various areas of life, such as gainful employment, living situation, and family life.

In general, the SOEP data for Germany tend to confirm the international findings of lower wellbeing among LGBs (see Table 3).<sup>18</sup> In comparison to heterosexuals, LGB answers indicate somewhat lower satisfaction with life in general (a rating of 7.0 vs. 7.4). Further, gay and bisexual men report higher psychological stress than heterosexual men (not presented in the form of a table broken down by gender). LGBs also report having ever been diagnosed with a depressive disorder twice as often as heterosexuals (20 percent vs. ten percent).<sup>19</sup>

LGBs are less satisfied with their health and family life than heterosexuals—a finding in line with previously reported findings.

However, there are no differences in physical health.

### Virtually no differences in personality structure

In psychological research, a person's personality is often mapped using a five-factor structure (the "Big Five" traits), consisting of: openness, conscientiousness, extraversion, agreeableness, and emotional stability.

In the existing body of scientific studies conducted on the personalities of LGBs or heterosexuals, almost no differences emerged.<sup>20</sup>

According to the SOEP data, among men in Germany only two of the five traits show differences (Table 4). Gay and bisexual men reported being somewhat less emotionally stable than heterosexual men (3.7 vs. 4.0).

**18** In the Netherlands Kinship Panel Study (NKPS) as well, 180 respondents in same-sex relationships report lower life satisfaction than the 9,869 respondents in [different-sex] relationships. See Samantha L. Tornello, Katya Ivanova, and H.M.W. Bos, "Same-Sex and Mixed-Sex Couples in the Netherlands: The Association Between Life Satisfaction and Relationship Dynamics," *Journal of Family Issues* (2017).

**19** This difference in the prevalence ratio is almost as high for men (gay and bisexuals 13.5 percent, heterosexuals: 7.2 percent) as for women (lesbians and bisexuals: 25 percent, heterosexuals: 11.6 percent). The values reported on the basis of SOEP data for the occurrence of depressive disorders roughly correspond with the findings of the Study on the Health of Adults in Germany (*Studie zur Gesundheit Erwachsener in Deutschland*, DGES) of the Robert-Koch-Institut. There a prevalence of depressive disorders is reported for 7.8 percent of men and 15.4 percent of women. See M.A. Busch et al., "Prävalenz von depressiver Symptomatik und diagnostizierter Depression bei Erwachsenen in Deutschland", *Bundesgesundheitsblatt*, 56 (2013): 733-739.

**20** A national representative study from New Zealand found differences between homosexual and heterosexual men on two of the Big Five traits and only on one of the five traits between homosexual and heterosexual women. See Lara M. Greaves et al., "Personality across sexual identity and gender in a national probability sample in New Zealand," *Sex Roles* 1-10 (2017).

This finding is in line with their higher perceived psychological stress. They also reported being somewhat more open to new experiences than heterosexual men and women (5.0 vs. 4.5 and 4.6). The difference in openness could also be caused by the SOEP survey procedure: men who are more open than average may have been more likely to provide information on their sexual orientation to the same sex.

With regard to the traits of conscientiousness, extraversion, and agreeableness, there was no statistical difference for men.

In addition, the study found no personality differences for women: lesbians, bisexual women, and heterosexual women all reported similar values for all of the Big Five traits.

### Political attitudes: strong support for the Green Party and the Left Party among LGBs

LGBs are somewhat more interested in politics than heterosexuals. They also reported long-term party identifi-

cation with statistically greater frequency (68 percent vs. 56 percent). The distributions also vary, possibly due to differences in life situations and party platforms (Table 5). Significantly fewer LGBs who reported long-term party identification support the Christian Democrats (*Christlich Demokratische Union*, CDU, and *Christlich-Soziale Union in Bayern*, CSU) (21 percent vs. 35 percent of all persons with long-term party identification). However, support for the Green Party (*Bündnis90/Die Grünen*) and the Left Party (*die Linke*) is higher among LGBs than among heterosexuals (27 percent vs. 16 percent and 13 percent vs. seven percent, respectively).

**Conclusions**

The SOEP data show that, contrary to existing stereotypes, homosexual and bisexual people are no different than heterosexuals when it comes to personality. However, the two groups differ in some aspects of their life situations: LGBs pursue different professions than heterosexuals; they earn lower wages, more often live alone, and count on their relatives for support less frequently, relying more on friends. The study presented here provides only initial findings that could offer a point of departure for more in-depth analyses.

From the perspective of the social sciences and economics, it would be desirable to factor in the sexual orientation

of respondents when reporting on social issues in Germany. This is already widespread practice in the United States, for example. This could allow better documentation of life situations and help to identify areas where action is crucially needed—for instance, in fighting discrimination. The European Council already advises member states to “collect and evaluate relevant data in order to monitor and eliminate all direct or indirect discrimination due to sexual orientation or gender identity.”<sup>21</sup> In a similar vein, within the context of the “EU Roadmap against homophobia and discrimination on grounds of sexual orientation and gender identity,” EU institutions have repeatedly called upon EU member states to “regularly survey relevant comparable data on the situation of LGBTI persons in the EU.”<sup>22</sup>

Implementing these measures by supplementing the federal government’s current reporting on social issues with the traits of sexual orientation and gender identity would require an expansion of the existing empirical database for Germany. For example, it would be necessary to

21 Council of Europe, “Recommendation CM/Rec(2010)5 of the Committee of Ministers to member states on measures to combat discrimination on grounds of sexual orientation or gender identity,” (Web page, Council of Europe, Brussels, 2010). (available online, accessed July 22, 2017)

22 European Parliament, “Resolution of 4 February 2014.”

add special samples to existing nationwide longitudinal studies such as the SOEP, along with the corresponding selection and projection frameworks.

Particularly with regard to the reported wage differences, which cannot be explained by differences in qualifications, experience, sectors, or work time models, the findings presented here indicate a need for action in the political sphere to promote equality between LGBs and heterosexuals.

The low frequency of vocational training as opposed to tertiary education among LGBs and the differences in wages reported here are not enough to prove that LGBs face discrimination in the job market. However, since these differences cannot be explained by different levels of qualifications or professional experience, it is essential to find the reasons for the wage differences. To the extent that LGBs are indeed being discriminated against, not only the legal methods of countering discriminatory hiring and wage policies but also corporate culture itself must be improved to hold diversity in high regard.

Table 5

**Political attitudes**

Share in percent

	Heterosexuell		LGBs (3)	Difference (1-3)	Difference (2-3)
	For information purposes: Without age adjustment (1)	Adjusted to age structure LGBs (2)			
Political interest <sup>1</sup>			44		*
Long-term party identification <sup>2</sup>	62	56	68		**
<i>of that number<sup>3</sup>:</i>					
SPD	31	29	25		
CDU/CSU	38	35	21	**	**
FDP	3	3	3		
B90/Green Party	13	16	27	**	**
Left Party	7	7	13	*	*
Rep/DVU/NPD	1	1	3		
AfD	3	4	4		
Other	3	4	5		

<sup>1</sup> To measure political interest, respondents were asked the following question: "Generally speaking, how interested are you in politics?" The four response categories range from "very interested" to "disinterested". For the table, the two lower categories were condensed into "no" and the two upper categories into "yes".

<sup>2</sup> To measure party identification, respondents were asked the following question: "Many people in Germany lean towards one party in the long term, even if they occasionally vote for another party. Do you lean towards a particular party?"

<sup>3</sup> Percentage of respondents with party affiliation (sums to 100).

Significance levels: \*;  $p < 0.05$ ; \*\*;  $p < 0.01$ .
