SOEP Survey Papers
Series D – Variable Descriptions and Coding

SOEP-Core v37 – PPATHL: Person-Related Meta-Dataset

SOEP Group

Running since 1984, the German Socio-Economic Panel (SOEP) is a wide-ranging representative longitudinal study of private households, located at the German Institute for Economic Research, DIW Berlin.

The aim of the SOEP Survey Papers Series is to thoroughly document the survey's data collection and data processing. The SOEP Survey Papers is comprised of the following series:

- Series A – Survey Instruments (Erhebungsinstrumente)
- Series B – Survey Reports (Methodenberichte)
- Series C – Data Documentation (Datendokumentationen)
- Series D – Variable Descriptions and Coding
- Series E – SOEPmonitors
- Series F – SOEP Newsletters
- Series G – General Issues and Teaching Materials

The SOEP Survey Papers are available at <http://www.diw.de/soepsurveyspapers>

Editors:

phrf1 – Weighting factor without new samples (wave 1)	36
prgroup – Random Groups	36

1 General Information

The path datasets should be the building block of any analysis. Path Files indicate the total population at the household and individual level (over time) and provide all IDs necessary to access further files at different levels (Krause/Glass/Reher 2019a,b). Path-Files are delivered in three data formats – in long-format [H|P-PATHL] (as the most comprehensive version including weighting variables), in wide-format [H|P-PFAD] (the traditional version), and in a short-version [H|P-PATH] as a reduced population file (indicating the total of population of households and individuals) Household Level [HID|SYEAR] {Navigation File: H-PATH-L (long-format)} Individual Level [PID|SYEAR] {Navigation File: P-PATH-L (long-format)} Household Level [HID] {Population File: H-PATH} Individual Level [PID] {Population File: P-PATH} Household Level [HID (HHNRAKT)] {Path File: HPFAD (wide-format)} Individual Level [PID (PERSNR)] {Path File: PPFAD (wide-format)}. The constituting SOEP population considers three levels – cases, households, and individuals. Due to the SOEP sampling and survey process, these levels follow an implicit hierarchy. All samples refer to primary source households – indicated by the household id at the time when the survey starts – the (fixed) Case ID [CID]. New Households may emerge from these original households during the longitudinal survey process by split-offs of family members – all (current) households are therefore indicated by a (variable) Household ID [HID]. IDs for individuals living in the households are derived from the households, where they were living when they were surveyed for the first time – the (fixed) Personal ID [PID]. It is recommended to use the (almost) time-independent (demographic) information like sample membership, sex, year and country of origin are adjusted on a wave-by-wave basis in the framework of demographic testing.

2 Primary Key, Foreign Keys and Sample Information

pid – Never Changing Person ID

A person can be uniquely identified with variable PID. Together with SYEAR primary key in this file.

syear – Survey Year

1984	16252
1985	16737
1986	15868
1987	14974
1988	14596
1989	14000
1990	19666
1991	19713
1992	19552
1993	19240
1994	19469
1995	19947
1996	19527
1997	19064
1998	21175
... (7 rows omitted)	218991
2006	32747

2007	30962
2008	29005
2009	31642
2010	45977
2011	50329
2012	50120
2013	55611
2014	51684
2015	50277
2016	57287
2017	64554
2018	62491
2019	62829
2020	63063

Together with PID primary key in this file.

hid – Current Wave HH Number

The household the person belongs to in the corresponding year (SYEAR).
 For more information, contact: Peter Krause (Tel. 030-89789-690)

psample – Sample Member

1	A 1984 Initial Sample (West)	280277
2	B 1984 Migration (until 1983, West)	95664

-4	Inadmissible multiple response	0
-5	Not included in this version of the questionnaire	0
-6	Version of questionnaire with modified filtering	0
-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

The sample membership never changes.

For more information, contact: Peter Krause (Tel. 030-89789-690)

cid – Original Household Number, Case ID

Case Id - Household Source Identifier. The fixed household source id points to the first SOEP ancestor household for this person. The person does not necessarily need to have ever lived in a household with this number. This is relevant for sampling information and calculating the weights.

rv_id – ID SUF pension insurance

This variable indicates available information and files for the entire SOEP individuals. Netto-codes 10-19 (and 29) define the respondents population of PGEN, the codes 20-28 indicate children, 30-39 unit-non-responses in partially realized households, and the codes 90-99 describe permanent (or temporary) dropouts. Further differentiations point to the survey instruments (questionnaires). The Codes 10-39 describe the population in realized (and partially realized households).

It is possible that Individuals from different original households (CID) move together in one common household. Then people with identical values for (HID) in one wave may have different values for CID. Only for those persons moving together CASEMAT contains the HID of the other household members. This information is not relevant when linking person and household data based on the current household number HID.

The month of birth of a respondent is created with information from net and gross datasets (i.a. information from questionnaires header or household protocol). For about 96% of the respondents, there was no discrepancy between this information. In 3.3% of the respondents, the mode of the month of birth is used when there is differing information. For the

rest, the most plausible/newest information was used (for less than 1%). For about 20% of respondents there was no information about the month of birth at all, but for about 1000 persons it was possible to use indirect information, such as the move-in date of a newborn child.

The variable TODJAHR contains the four-digit year of death for persons whose death could be firmly established or a missing value code:

- (-2): persons, for whom it is unknown whether they are deceased (that is, both persons still living up to that wave, and persons whose exact whereabouts is unknown and have dropped out of SOEP)
- (-1): persons, for whom the fact of death is known, but the year of death is unknown.

For all persons who have been identified as deceased over the course of SOEP, the variable TODINFO gives the source of this information.

53 persons were identified as deceased in the Infratest Field Organization Study (Follow-up study of drop-outs between 1984 and 1992) carried out from April – June 1992.

In the framework of the Infratest Field Organization Study (follow-up study of drop-outs) of 2001, a total of over 700 persons were identified as deceased. Among them were several with multiple entries for year of death, that is, persons who were already identified as deceased in the standard wave-to-wave follow-up procedure (stored in the file PBR_EXIT) or in the Infratest Field Organization Study of 1992. A generally very high level of correspondence was found between the information given in the standard follow-up procedure and the point of death established ex-post in the Infratest Field Organization Studies. For ten persons, the year of dropping out of SOEP was used to impute the missing year of death. In the third of those follow-up studies which has been conducted in 2007, another 21 individuals were identified as deceased between 2001 and 2005. For 18 of those persons a valid year of death could be investigated, for the remaining three observations for which the exact year of death is unknown, TODJAHR has been set to the standard missing code “-1”.

When the data from the Infratest Field Organization Study contradicted the data from PBR_EXIT, the data from the Field Organization Study was used.

BIRTHREGION contains information about the German Federal State (“Bundesland”) a person was born. In 2012 the SOEP asked all current respondents about the place of birth: “Where were you born? If there are other towns or cities with the same name, or if the town is very small, please state the nearest city. Please write the name of the town in the left blank and any additional information in the right blank. For example, write ‘Düsseldorf’, ‘Frankfurt an der Oder’, or ‘Frankfurt am Main’ in the left blank, and in the case of ‘Roßdorf bei Schmalkalden’, write ‘Roßdorf’ in the left blank and ‘bei Schmalkalden’ in the right blank. Since then this question has been part of the biography questionnaire and a variable BIRTHREGION is provided in dataset PPATH, which has to be updated each year for new respondents. The answers is given in clear text and coded by Kantar at the level of municipalities for german cities or villages (including the geocodes for the city center). For places outside Germany, Kantar provides only the geocodes, if possible. However, the responses could not all be assigned to a unique municipality, therefore multiple municipality codes are provided by Kantar (up to 19 in 2012). For the variable *birthregion* in *ppfad* only those answers are used, where a unique assignment of a German Federal State (“Bundesland”), based on the possible municipality codes, was possible. For persons born in a SOEP household (the household was responding in this year) the code of the respective Federal State of this year is used.

-8	Question this year not part of Survey program	0

The SOEP data comprises a sizeable number of immigrants to Germany and their descendants. Several user-friendly variables identify these groups (GERMBORN, CORIGIN, IMMIYEAR, MIGBACK) and thus give information on the migration background of all persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL). In detail, GERMBORN and CORIGIN give information on the country of birth, with the exception of persons who immigrated to Germany before 1950 who are considered to have been born in Germany (the Federal Republic of Germany was founded in 1949). IMMIYEAR specifies the last year of immigration to the Federal Republic of Germany for all persons considered not born in Germany, and MIGBACK is useful to identify immigrant descendants by combining information on respondents and their (grand-)parents. In addition, GERMBORNINFO, CORIGININFO, IMMIYEARINFO and MIGINFO indicate the quality of information given in GERMBORN, CORIGIN, IMMIYEAR and MIGBACK, respectively. All SOEP samples include immigrants to Germany and their descendants. The shares vary, however, across samples depending on the target population covered. Naturally, samples covering the entire residential population in Germany (Sample A, E, F, G, H, I, J, K, L1, L2, L3 and N) or specific groups such as persons from the former GDR (Sample C) contain a smaller number of immigrants and their descendants than the samples of foreigners and migrants (Sample B, D, M1, M2, M3, M4 and M5) or the sample of households in urban areas (Sample O).

Information for GERMBORN, CORIGIN, IMMIYEAR and MIGBACK and the respective INFO variables is collected primarily from the individual questionnaires (dataset PL) or the variations of the “biography / life history” questionnaires (integrated biographical data files and life-course information in dataset (BIOL) and from the additional youth questionnaire for 16-17-year-olds, in use since 2000 (dataset JUGENDL). In addition, information from the electronic household protocol for M1 (2013) and the retrospective survey (2012) of early childhood in the context of war (dataset BCBFK) was used (both datasets are not included in the standard data distribution).

GERMBORN specifies whether a person was born in Germany or in another country. Persons who immigrated to Germany before 1950 are considered as being born in Germany (the Federal Republic of Germany was founded in 1949; see also IMMIYEAR). To code GERMBORN, all relevant information (see Table 1: Information used for GERMBORN, CORIGIN, IMMIYEAR and MIGBACK) available on persons who have ever been a part of a SOEP

household (i.e., the population from PPFAD, PPATH or PPATHL) was combined. The vast majority of persons who have ever been part of a SOEP household gave consistent information on their country of birth and GERMBORN was coded accordingly to the respondents' answers. For part of the population, no direct information on the person's country of birth was available. For both, persons for whom "(2) inconsistent information" or "(3) no information" (GERMBORNINFO) was available, additional indicators were used to code the GERMBORN values. In this process, information on a respondent's citizenship and their parents' migration biography were used. We coded the values on GERMBORN in the following order (with descending priority):

1. First, mothers' immigration history and their place of residence at the time of the respondents' birth were taken into account to determine the respondents' probable country of birth. For instance, when a respondent was born after or in the year of their mother's immigration to Germany, the respondent is considered to have been born in Germany. For the coding of a few cases, more detailed information on respondents' month of birth and mother's immigration month was available and used. When a mother's immigration year was missing, the father's immigration history was used to code a respondent's country of birth.
2. In the next step, GERMBORN was coded for the remaining "(2) inconsistent information" cases. Respondents' information on their country of birth, their citizenship, and parental information was taken into account to identify a respondents' country of birth. The mode was calculated for inconsistent information on respondents' and parental country of birth. In case of varying modes, higher values were given a preference when coding, to be more sensible to foreign countries of birth. For instance, a respondent who reported being born in Germany more often than being born abroad (country of birth), who had German citizenship (citizenship), and whose parents reported more often to be born in Germany than being born abroad (parental information) was considered to have been born in Germany.
3. In a last step, GERMBORN was coded for the remaining "(3) no information" cases. Respondents' citizenship and parental information was used to approximate their most likely country of birth. By definition, information on their country of birth was missing. The mode of parents' country of birth and citizenship was used for the coding of GERMBORN, too. For instance, respondents with German citizenship whose parents reported more often to be born in Germany than being born abroad were coded as being born in Germany.

GERMBORNINFO indicates the quality of information given in GERMBORN. As in previous years, all relevant information available on persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) was combined into a working dataset and compared to code GERMBORN. When information in this working dataset consistently indicated that a person was born either in Germany or abroad, GERMBORNINFO was coded with a (1) for “consistent information”. Over the course of the SOEP survey, some individuals may have stated on one occasion that they were born in Germany and on another that they were born abroad; such information was considered as inconsistent information (value (2) on GERMBORNINFO). The GERMBORNINFO value “(3) no information” refers to persons who lived in a SOEP household but had not completed an individual, life history, or youth questionnaire up to the present date or they had given an interview but did not answer the question on their country of birth (item non-response).

For persons who, according to GERMBORN, were not born in Germany, the variables CORIGIN and IMMIYEAR designate the country of origin and the year of immigration to Germany, respectively. Respondents who were born in Germany were assigned the code (1) (see GERMBORN). Persons who were not born in Germany were assigned another country of birth than Germany depending on the information given in the wave-specific individual questionnaires (dataset PL) or the variations of the “biography / life history” questionnaires (dataset BIOL) and from the additional questionnaire for 16-17-year-olds in use since 2000 (dataset JUGENDL). In addition, information from PBRUTTO (Person-Related Gross File), the electronic household protocol for M1 or the retrospective survey of early childhood in the context of war and the post-war period (dataset BCBFK) was used. To code CORIGIN, all relevant information (see Table 1) available on persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) was compiled into a working dataset.

CORIGININFO indicates whether “(1) consistent”, “(2) inconsistent” or “(3) no information” was available on a respondent’s country of birth. When information in this working dataset consistently indicated a specific country of origin, CORIGININFO was coded “(1) consistent information” and the respective country of origin was mentioned in CORIGIN. The SOEP team also considered information as “(1) consistent” in the following two additional cases (with descending priority):

1. When state transformations (e.g., their founding or dissolution) may have led to respondents reporting different countries of birth over the course of the SOEP survey, information was considered consistent. For instance, respondents may have stated the Union of Soviet Socialist Republics (USSR) as their country of birth in 1987 but stated Russia in a later questionnaire. Other examples refer to the dissolution of the Socialist Federal Republic of Yugoslavia in 1992 and their temporary and contemporary successor states, such as “(119) Croatia”, “(120) Bosnia and Herzegovina”, “(121) Macedonia”, “(122) Slovenia”, “(165) Serbia”, “(168) Montenegro”. In such cases, CORIGIN was coded with the most contemporary successor state mentioned by a respondent or third party. This may also include regions or ethnic groups that respondents mentioned, such as “(140) Kosovo-Albanian” or “(149) Kurdistan”.
2. When a respondent or third party mentioned a rather unspecific region of birth such as “(12) Benelux”, “(222) Eastern European” or “(999) Ethnic minority” and at another time mentioned a more specific country of origin or citizenship within this region, information was considered consistent. The more specific country of origin was used in CORIGIN.

The vast majority of the foreign-born population (see GERMBORN) who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) gave

consistent information on their country of birth (see CORIGININFO). For around a third of the foreign-born population, no direct or inconsistent information on the person's country of birth was available. For those respondents who were not born in Germany and whose country of birth could not be determined (CORIGININFO value (2) and (3)), additional indicators were used to code their country of origin (CORIGIN). The generation process was conducted in the following order (with descending priority):

1. The respondents' country of birth which occurred most frequently, in other words the mode, was used.
2. Respondents' country of citizenship was used as their country of birth if both were not German. The citizenship variable was constructed on the basis of all information given on first, second, and previous citizenships as well as naturalizations, and includes the countries of citizenship a respondent reported. Since citizenship information is collected annually for all persons who lived in a SOEP household, it is based on much more detailed information than the "(2) inconsistent information" collected for the country of origin. Respondents whose information on country of origin is "(2) inconsistent" answered on average three questions on their country of origin (from 2 to 5 answers).
3. Mothers' country of birth and citizenship were considered to be the respondents' most probable place of birth if the respondent was born before the mother immigrated to Germany (see also GERMBORN coding). If information on mothers' country of birth, mothers' citizenship and the respondents' citizenship was missing, fathers' country of birth and fathers' citizenship were used to code CORIGIN. Grandparents' country of birth and grandparents' citizenship were additionally used if information on mothers' and fathers' country of birth and citizenship were missing.
4. For the few cases without citizenship, (grand-)parental information and any information on their country of origin (CORIGININFO value (3)), respondents' legal status was used when it indicated that a person moved to Germany from an "Eastern European" country, resulting in the coding of a few cases to "(222) Eastern European" on CORIGIN.

If the country of birth was still missing after this procedure, CORIGIN was coded "(-1) don't know". CORIGIN includes a few more missing values than GERMBORN due to cases in which it was not possible to determine a country of birth other than Germany. To provide the highest level of transparency possible, we include a variable for the quality of information used to create the country of birth variable: CORIGININFO.

-8 Question this year not part of Survey program 0

CORIGININFO indicates the quality of information given in CORIGIN. As in previous years, all relevant information available on persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) was compiled into a working dataset and compared to code CORIGIN. CORIGININFO indicates whether “(1) consistent”, “(2) inconsistent” or “(3) no information” was available on a respondent’s country of birth after these comparisons. CORIGININFO is thus an indicator for the quality of information given in CORIGIN. The filtering of CORIGIN via GERMBORN was taken into account by implementing a separate category, “(4) Filter GERMBORN” on CORIGININFO for the persons who were considered being born in Germany on GERMBORN.

IMMIYEAR contains information on the year of immigration to Germany for all persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) and who were not born in Germany (see GERMBORN). The information on

this variable was collected from the wave-specific individual questionnaires (dataset PL) or the variations of the “biography / life history” questionnaires (dataset BIOL) and from the additional questionnaire for 16-17-year-olds in use since 2000 (dataset JUGENDL). Since sample M (starting in 2013), information on all of a respondent’s stays in Germany has been collected (up to 15 moves between countries, see MIGSPELL and REFUGSPELL in the SOEP Survey Paper Series). For all cases in which a respondent had more than one stay in Germany, IMMIYEAR contains the respondent’s last year of immigration to Germany. In addition, information from the electronic household protocol for M1 or the retrospective survey of early childhood in the context of war and the post-war period (dataset BCBFK) was used (both datasets are not included in the standard data distribution).

When information in this working dataset consistently indicated a specific year of immigration, IMMIYEARINFO was coded “(1) consistent information” and the respective year of immigration was stated in IMMIYEAR. The vast majority of the persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) gave consistent information on their year of immigration. For another part of the dataset no direct information on the person’s year of immigration was available. “(3) No information” either refers to persons who lived in a SOEP household but did not complete an individual, life history, or youth questionnaire up to now or to respondents who were interviewed but did not answer the questions on their year of immigration. Over the course of the SOEP survey, only very few cases gave “(2) inconsistent information” with regard to their year of immigration. For these cases, their latest year of immigration was used in IMMIYEAR. The respondent’s year of birth was used as their year of immigration if they mentioned a year of immigration that was before their year of birth.

For those respondents who were not born in Germany and whose year of immigration could not be determined (IMMIYEARINFO value (3)), additional indicators were used to minimize the portion of missing values. These indicators were used in the following order (with descending priority):

1. When a respondent entered the SOEP for the first time because they had just moved into the household from abroad (see PZUG from PBRUTTO), the household entry year was considered to be the same as the immigration year.
2. Mother’s year of immigration was used as a proxy for the respondent when the respondent was born before the mother immigrated to Germany. If a mother’s year of immigration was missing, the father’s year of immigration was used to code IMMIYEAR. If a mother’s and father’s year of immigration were missing, the maternal and paternal grandparents’ year of immigration were used respectively.

If the year of immigration was still missing after this procedure, IMMIYEAR was coded “(-1) don’t know”. IMMIYEAR includes more missing values than GERMBORN and CORIGIN due to cases in which it was not possible to determine a respondent’s year of immigration. However, users should be aware that the wording of questions on the year of immigration vary rather drastically over the course of the SOEP survey (see Table 2). To provide the highest level of transparency possible, we include a variable for the quality of information used to create the year of immigration variable: IMMIYEARINFO.

Table 2: Variations of the SOEP questions regarding respondents’ year of immigration (main indicators for IMMIYEAR and IMMIYEARINFO)

Category	Question	Dataset(long format)	Sample	Years
<i>Respondent information</i>				
First	What year did you move to the Federal Republic of Germany (including West Berlin) for the first time?	PL	B	1984-1990 1992-1993

IMMIYEARINFO indicates the quality of information given in IMMIYEAR. As in previous years, all relevant information available on persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL) was compiled into a working dataset and compared to code IMMIYEAR. IMMIYEARINFO indicates whether “(1) consistent”, “(2) inconsistent” or “(3) no information” was available on a respondent’s country of birth after these comparisons. IMMIYEARINFO is thus an indicator for the quality of information given in IMMIYEAR. The filtering of IMMIYEAR via GERMBORN was taken into account by implementing a separate category “(4) Filter GERMBORN” on IMMIYEAR-INFO for individuals who were considered to have been born in Germany on GERMBORN (for more information, see GERMBORN). When information in this working dataset consistently indicated a specific year of immigration, IMMIYEARINFO was coded “(1) consistent information” and the respective year of immigration was stated in IMMIYEAR.

-8	Question this year not part of Survey program	0

MIGBACK contains information on respondents’ migration background for all persons who have ever been a part of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL). In comparison to GERMBORN, the variable MIGBACK is useful to identify immigrants’ descendants by combining information on respondents’ country of birth (see GERMBORN) and (grand-)parental information such as their country of birth and their citizenship. The information for this variable comes predominantly from PPATH (GERMBORN), auxiliary citizenship variables (for more information, see Table 1 under sub-heading “citizenship and legal status” and sub-heading “family information”), and the relevant biographical data sets (dataset BIOIMMIG). The variables were also updated using information from the wave-specific individual questionnaires (dataset PL), the variations of the “biography / life history” questionnaires (dataset BIOL), and the additional questionnaire for 16-17-year-olds in use since 2000 (dataset JUGENDL).

Respondents were assigned to the MIGBACK categories based on country of birth (see GERMBORN): Being born in another country than Germany indicates, by definition, a direct migration background (2), while respondents born in Germany may have either no (1) or an indirect (3) migration background. Respondents whose parents had no migration background

were assigned the code “(1) no migration background”, while respondents whose father or mother had a migration background were assigned the code “(3) indirect migration background”.

Grandparental information were additionally used if information on mothers’ and fathers’ migration background were missing. Please note that any updates in related variables may also lead to an update of the MIGBACK variable. For instance, a respondent who never stated his or her citizenship but later states having a foreign citizenship will be classified as having a migration background of some form. This retrospective perspective may lead to updates of the migration background variable with every new wave.

In a few cases, “(1) no (grand-)parental information” (see MIGINFO) was available but we were nonetheless able to identify respondents with an “(2) indirect migration background” (see MIGBACK). In these cases, respondents were born in Germany but further variables (for more information, see Table 1 under sub-heading “citizenship and legal status” and sub-heading “East German, Ethnic German, or migrated before 1949”) suggested that there was a migration background (e.g., ethnic Germans). MIGBACK may slightly underestimate the number of persons having an “(3) indirect migration background”, since some of the respondents born in Germany with missing (grand-)parental information and for whom no further indicators were available may be the descendants of immigrants.

For more information, contact: Selin Kara (Tel. +49 30-89789-345)

-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

MIGINFO indicates the quality of information given in MIGBACK. MIGINFO provides information about the usage of (grand-)parents’ migration histories in the SOEP. Overall, MIGINFO can take on two different codes: “(1) No (grand-)parental information” or “(2) At least 1 (grand-)parental information available”. The (grand-)parental information refers to any information on the migration background of the respondents’ mother, father or grandparents. This includes information on the country of birth (for more information, see Table 1 under sub-heading “family information”) and auxiliary citizenship variables (for more information, see Table 1 under sub-heading “citizenship and legal status” and sub-heading “family information”).

Please note that the MIGINFO coding from 2015 (v32) is further differentiated between the availability of direct and proxy information on respondents. We changed the MIGINFO coding due to the introduction of the GERMBORNINFO variable in 2016 (v33). The quality of information given in MIGBACK can thus only be assessed by combining the GERMBORNINFO and MIGINFO variables. MIGBACK information is considered to be highly reliable in cases coded (2) “At least 1 (grand-)parental information available” on MIGINFO and (1) “Consistent information” on GERMBORNINFO (around half of the PPATH cases). In contrast, the quality of information given on MIGBACK is considered relatively uncertain in

cases where parental information ((1) “No (grand-)parental information” on MIGINFO) and respondents’ information was missing ((3) “No information” on GERMBORNINFO)).

-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

The variable LOC1989 in the meta-file PPFAD / PPATH provides information about a person's residence prior to German reunification, distinguishing among "(1) German Democratic Republic [GDR]", "(2) Federal Republic of Germany [FRG] (including West Berlin)", and "(3) abroad". Respondents born after 1989 (GEBJAHR in PPATH) were coded as "(-2) does not apply" on LOC1989. This information has been generated for all individuals who were ever a member of a SOEP household (i.e., the population from PPFAD, PPATH or PPATHL). LOC1989 combines information from two main sources: In 2003, the individual questionnaire included information on the place of residence before German reunification (dataset TP). Since 2004, this question has been included in the biography questionnaires (dataset BIOL). Along with these sources, the following indicators were used to code the variable LOC1989 (with descending priority):

1. HID in PPATHL: Place of residence in the former FRG before German reunification
2. IMMIYEAR in PPATH: Respondents who first immigrated to Germany after 1989 were coded as living "(3) abroad" in 1989
3. IMMIYEAR, CORIGIN in PPATH: Respondents from countries holding agreements on labor recruitment with the FRG who immigrated to Germany before 1990 were assumed to have been living in the "(2) Federal Republic of Germany [FRG] (including West Berlin)" in 1989
4. IMMIYEAR, CORIGIN in PPATH: Respondents from countries holding agreements on labor recruitment with the GDR who immigrated to Germany before 1990 were assumed to have been living in the "(1) German Democratic Republic [GDR]" in 1989
5. PSAMPLE in PPATH: Respondent's sample affiliation in 1990, differentiating between members of the former West samples (A, B) and the former East sample (C)
6. SAMPREG in PPATHL & BRMOVEIN and SYEAR in BIORRESID: Respondents who moved into their current dwelling in the former FRG or GDR before 1989
7. SAMPREG in PPATHL: Respondent living in the West or East sample region in 1990

The vast majority of information given in LOC1989 is based on information from these sources. For the remaining respondents, indirect information is derived from the following proxies to code their place of residence in 1989:

1. PZUG in PBRUTTO: New entrants to the SOEP who previously lived in East Germany or abroad
2. BSSCHEND and BSSCHWO in BIOSOC: Place and year of the last school attended
3. PGRUPPE in PBRUTTO: Place of birth that was asked in 1995
4. PL: Country of origin GDR
5. PNAT_V2 in PBRUTTO: Citizens of (former) GDR
6. PL: Place of residence in 1984
7. BIOPAREN and PPATH: Parental residence in 1989 for individuals younger than 18 in 1989

For more information, contact: Selin Kara (Tel. +49 30-89789-345)

locinfo – Loc1989: Source / Quality of information

0	Respondent born after 1989	296476

The variable LOCINFO indicates the quality of information given in LOC1989, differentiating between direct and indirect information. LOCINFO provides information about the use of proxy information in the process of generating LOC1989 due to missing values in respondents' and their parents' residence in 1989 in the SOEP. Overall, LOCINFO can take on three different codes: either "(1) direct" or "(2) indirect information" is available on respondents or they were "(0) born after 1989".

For more information, contact: Selin Kara (Tel. +49 30-89789-345)

sampreg – Current sample region (Berlin, West-East)

-4	Inadmissible multiple response	0
-5	Not included in this version of the questionnaire	0
-6	Version of questionnaire with modified filtering	0
-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

POP was derived from WUM2 in HBRUTTO as well as PNAT_V* and STELL_V* (nationality and relationship to head of household in PBRUTTO). Missing values were imputed based on the person's history. Thus, the only admissible missing value is –2, meaning not applicable. This variable is therefore particularly important, as it enters into the determination of cross-sectional weights. The variable corresponds with HPOP in HPATHL. See also the description of NETTO.

sexor – Sexual Orientation

0	probably heterosexual	783356
1	probably bi/homosexual	11822
2	insufficient information	432171
-1	No Answer	0

-5	Not included in this version of the questionnaire	0
-6	Version of questionnaire with modified filtering	0
-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

The variable SEXOR combines information on the sexual orientation of respondents from various sources in the SOEP. In 2016 (wave BG), (1) a direct question about sexual orientation was introduced (self-rep). Questions on marital status in the SOEP distinguish between same-sex civil unions and different-sex marriages. This distinction has been introduced in the household questionnaire since waves 2002 (wave S), in the person questionnaire since 2011 (wave BB), and in the biographical questionnaire since 2012 (wave BC). Starting with these years respectively, we use information of (2) the head of household on marital status of all household members (civil-hh), information on the marital status (3) reported by individuals in the person questionnaire (civil-p), as well as reported (4) in the partnership biography (civil-bio). Finally, the SOEP team provides pointers to the partner of each person

in the SOEP households since 1984 (see `pgpartnr` in `pgen` documentation or `parid` in `ppathl` documentation). Combining information on the gender of both partners cohabitating in the SOEP household provides (5) the final source of information on the sexual orientation of adults in the SOEP (`pointer`).

Self-reports on sexual orientation surveyed in 2016 distinguish between the response options heterosexual, bisexual, and homosexual. It is however impossible to clearly identify bisexual respondents from data on same-sex and different-sex partnerships even in longitudinal studies like the SOEP. This is because some bisexual respondents may be observed at periods of no-cohabitation, only same-sex, and only different-sex partnerships. Without any observed change in the partner's gender, we are unable to identify respondents as bisexual. Our approach to this problem is as follows: first, we do not seek to distinguish between homo- and bisexuals in the generated `SEXOR` variable. That is, we code individuals with (at least) one observation of a same-sex partnership as homo/bisexual. We code individuals with information from at least two years (arbitrary threshold) on only different-sex relationships as heterosexual. Since bisexuals in stable/multiple different-sex partnerships are misclassified as heterosexuals instead of homo/bisexuals, we add the label "probably" to our generated variable to indicate that this information is potentially erroneous. In the case of no information on partnerships or only one year of information on different-sex partnerships we consider this insufficient to make any inferences on sexual orientation in these individuals on the basis of their observed partnerships.

Finally, the `sexor` variable integrates both the self-reported as well as the partnership-obtained information on sexual orientation.

This integer variable indicates which sources of information coincide with the value of SEXOR for the respective respondent. Its digits in binary representation are to be interpreted as binary flags, according to the following scheme: 1=Partner, 2=Marital status, 4=Relation to head of household, 8=Biography, 16=Self-reported. If SEXORINFO has the value $5=1x1+0x2+1x4$, this means that partnership pointers and relationship to head of household variables indicate the sexual orientation which is coded in SEXOR. Similarly, a value of 16 indicates that the inference was drawn from the direct question about sexual orientation. The variable is labeled accordingly.

parid – Partner Person Number

Partner indicators have the purpose of defining couples in SOEP households and thus to make possible analyses on the dyadic level. Persons without spouse and (cohabitating) partner receive a missing code “-2” (=does not apply). Also, the variable PARTNER is coded 0, 3, 4, 5 in these cases. In couples, partner is the value of the unchanging person ID number (=PID) of the partner. The assignment of the partner ID within households is based on four sources of information: A question in the person-file, that asks (unmarried) respondents to identify their partner in the household (bhppnr in 2017) (plk0001 in pl), the household matrix reported by the head of household at the beginning of the interview (bhstell in 2017) (stell_v1 stell_v2 stell_h in pbrutto), the partnership biography in the lifehistory calendar reported by new respondents (see also, biomars), and self-reports on marital status and life events, such as marriage, move in with partner, separation, etc. In unclear cases, due to temporal non-response for instance, we also consider longitudinal information from previous and prospective waves. Moreover, PARID is self-consistent between two individuals. For analyses of partner relationships, this information can be used to link all persons with their respective partners, and all information on both partners can also be stored in a common dataset.

partner – Status Of Partnership

0	No partner	601551
1	Spouse, registered partner	532590
2	Partner	82406
3	Probably spouse, registered partner	1370
4	Probably partner	2091

-5	Not included in this version of the questionnaire	0
-6	Version of questionnaire with modified filtering	0
-7	Only available in less restricted edition	0
-8	Question this year not part of Survey program	0

The variable PARTNER generated in the context of the partner identifier (PARID) to describe whether a person in a SOEP household has a partner in that household, and if so, the type of relationship existing between the partners. Relationships with persons outside the SOEP household are not covered by this variable. Code 0 is assigned to all single persons living in households and those with partners outside the household. Codes 1 to 4 describe relationships. To assign Codes 1 and 2, the partnership has to be definable from the perspective of both partners unanimously. If conflicting information exists between partners, the codes 3 or 4 are assigned. If it is unclear whether an individual has no partner or whether she forms a couple with one other household member, we assign the code 5. Registered partnerships (civil unions) for same-sex couples were introduced in Germany in 2001. Though, registered partnerships are legally not equal to marriage, they are listed in the same category.
